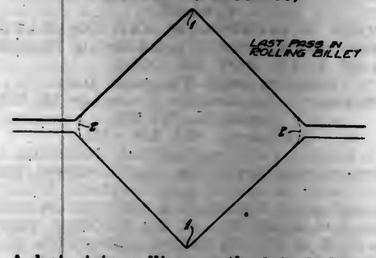
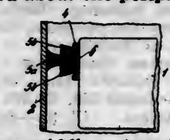
No Drawing. Application November 24, 1936, Serial No. 112,608
3 Claims. (Cl. 23—100)



1. A method of producing ammonium chloride crystals, including dissolving cadmium chloride and di-basic ammonium phosphate in a solution of ammonium chloride and producing said crystals from said solution.

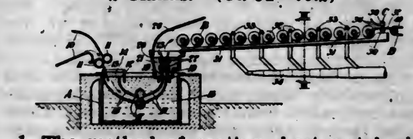
2,108,378
CAR TRUCK CONSTRUCTION
Jacob C. Larsen, Bexley, Ohio, assignor to The Buckeye Steel Castings Company, Columbus, Ohio
Application September 24, 1934, Serial No. 745,355
1 Claim. (Cl. 105—197)

In a car truck of the quick-wheel-change type, a side frame having a bolster opening and column guides, a spring plank extending into said opening, springs resting on the spring plank, a spring cap resting on said springs and provided with means for limiting outward movement of said springs, said spring cap being provided with upstanding posts engageable with said columns for guiding the spring cap vertically, a bolster having an end portion extending into said opening and resting on the spring cap, the opposite sides of the end portion of the bolster being shaped to readily move through the upper end portion of the bolster opening, the top of the end portion of the bolster being normally spaced from the top of the side frame to allow the bolster to be raised relative to the spring cap, means interlocking said bolster and cap and permitting detachment of the cap when the bolster is elevated relatively to the cap a distance less than the height of said posts, and a lug depending from the bolster for limiting inward movement of the upper end portions of said springs.



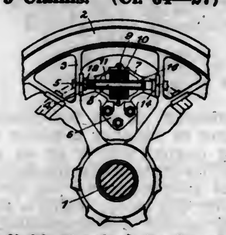
2,108,379
HOT STRIP ROLLING
Ross L. Leffler, McKeesport, Pa.
Application May 19, 1936, Serial No. 80,594
3 Claims. (Cl. 80—60)

1. A hot strip rolling method including producing a billet with rolled opposite corners and rolling down parts of said billet between said corners while permitting the latter to spread and become edges of the strip.



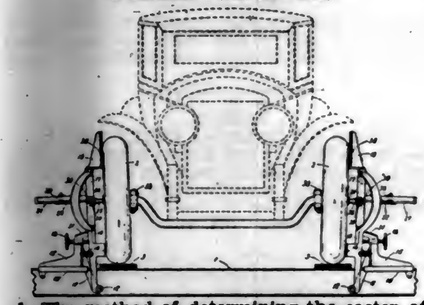
2,108,380
PERIPHERAL SEALING MEANS FOR TANKS
Boris Lentschewsky, Berlin, Germany
Application January 21, 1935, Serial No. 2,824
In Germany March 24, 1931
1 Claim. (Cl. 220—26)

A floating top for tanks employed for storing liquids, comprising a plurality of relatively movable and interconnected floating sections adapted as a whole to the form of the tank and sealing brushes disposed about the periphery of the said



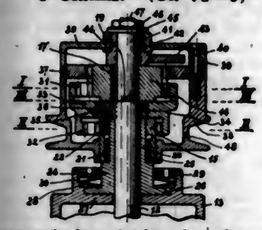
roof comprising a middle series of relatively long thin and soft bristles and upper and lower rows of short and stiffer bristles supporting the said long bristles.

2,108,381
METHOD OF COATING SHEET METAL
James R. McElhaney and Robert Stoker, Vandergrift, Pa., assignors to American Sheet and Tin Plate Company, a corporation of New Jersey
Application December 30, 1935, Serial No. 56,799
2 Claims. (Cl. 91—70.2)



1. The method of coating sheet metal which includes imposing thereon a coating of molten metal, superimposing on the coated or molten metal an unbroken protective oil coating consisting of approximately 70 to 85 per cent. palm oil and 15 to 30 per cent. of an oil selected from the group consisting of hydrogenated fish oil and cotton seed oil, said oil having a Saybolt viscosity range between 300 and 500, permitting the sheet to cool while thus protected, and finally removing the unbroken oil coating.

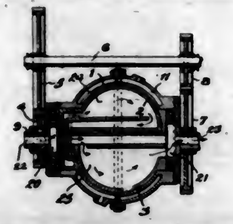
2,108,382
INDIVIDUAL AXLE DRIVE FOR VEHICLES
Gottlieb Meyfarth, Geneva, Switzerland, assignor of one-half to Société Anonyme des Ateliers de Sécheron, Geneva, Switzerland, a corporation of Switzerland
Application May 13, 1935, Serial No. 21,235
In Switzerland May 26, 1934
5 Claims. (Cl. 64—27)



5. In an individual axle drive for vehicles, comprising a spring coupling with a plurality of coupling elements, each of which comprises in combination a transmission device guided along its axis an axially guiding member, and a tangentially arranged cylindrical helical coupling spring which is operative between the guiding member and the transmission device, said spring being simultaneously supported on annular uninterrupted surfaces of the axially guiding coupling member and of the transmission device, a corepiece of the latter device being guided axially at both ends by annular uninterrupted surfaces of the axially guiding member.

2,106,383
METHOD FOR DETERMINING THE ALIGNMENT OF DIRIGIBLE VEHICLE WHEELS
James W. Morse, Lansing, Mich., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware
Original application September 21, 1931, Serial No. 564,097. Divided and this application May 12, 1936, Serial No. 79,371
3 Claims. (Cl. 33—203)

1. The method of determining the caster of a dirigible vehicle wheel which comprises measuring the inclination from the vertical of said wheel from its face, turning said wheel through a predetermined angle, again measuring the inclination from the vertical of said wheel from its face, both of said measurements being taken in a common plane perpendicular to the plane of the wheel when in straight ahead position, and comparing said measurements to determine the caster of the wheel in degrees.



2,106,384
TRANSMISSION GEAR FOR ELECTRIC STARTERS
Alexandre Moisy, St.-Prix, France
Application April 22, 1937, Serial No. 138,449
In France November 19, 1936
8 Claims. (Cl. 74—6)

1. A transmission device for changing a gear ratio according to whether a motor generator is in use as an engine starter or as a generator, comprising a first externally toothed pinion with unidirectional connection to the motor shaft, a sleeve borne on the motor shaft, a second externally toothed pinion unidirectionally connected to said sleeve, friction means for resisting rotation of said sleeve, a double diameter internally toothed pinion mounted eccentrically of said first and second pinions so as to engage both, and a driving connection between said first pinion and the engine to be started.

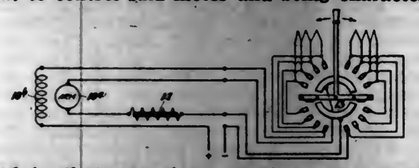
2,106,385
ROTARY ENGINE
Masasuke Murakami, Tokyo, Japan
Application August 30, 1935, Serial No. 38,617
In Japan April 22, 1932
2 Claims. (Cl. 230—144)

2. In a rotary engine having a plurality of co-operatively rotating discs hermetically fit in a working cylinder and held on independent coaxial shafts, a main shaft arranged outside of said cylinder and the transmission gearing between said main shaft and each of said disc shafts consisting of a plurality of pairs of non-circular gear wheels which will cause a continuously varying relative rotation between said cooperating discs while rotating altogether in the same direction without

repose with substantially uniform revolutions of said main shaft, said cooperatively rotating discs being made hollow and hermetically overlapped with each other at the central bosses and one end of each disc being enlarged to constitute a part of the cylinder cover and to form a water circulating chamber therein and a further extension of said hollow chamber constituting the disc shaft, on which the gear wheel is keyed.

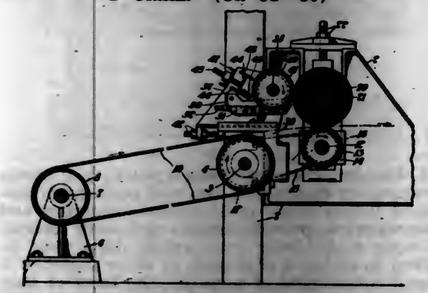
2,106,386
LUBRICANT PREPARATION
John M. Musselman, Cleveland, and Elliott B. McConnell, Shaker Heights, Ohio, assignors to Standard Oil Company, Cleveland, Ohio, a corporation of Ohio
No Drawing. Application November 14, 1935, Serial No. 49,824
7 Claims. (Cl. 87—9)

1. A lubricant comprising an oil having lubricating viscosity and a small proportion of a compound of general formula $NR.H_2NCH_2CO.R'(OH)_n$ in which R is a hydrocarbon radical and $R'(OH)_n$ a polyhydroxy benzene in which there are at least 2 hydroxyls and in 1,2 position.



2,106,387
VISCOUS, WATERPROOF AND INSULATING COMPOSITION WITH A BASIS OF RUBBER, TO BE USED HOT OR COLD
Nello Nardelli, Florence, Italy
No Drawing. Application December 14, 1934, Serial No. 757,588
5 Claims. (Cl. 106—23)

1. A viscous, tacky, waterproof, insulating, and friction composition of the class described, which is non-liquid at ordinary atmospheric temperatures and which comprises in combination melted rubber and colophony, in the following proportions: 75% to 95% of melted rubber, 25% to 5% of colophony.

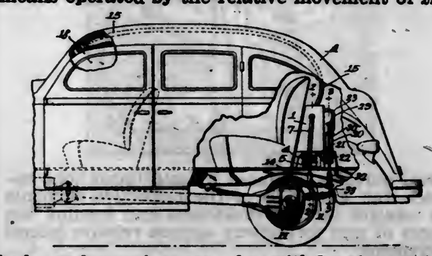


2,106,388
MOTOR POWERING SYSTEM
Cecil C. Parrish, Donora, Pa., assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application December 31, 1936, Serial No. 118,673
1 Claim. (Cl. 172—239)

A powering system for a direct-current series-wound electric motor driving heavy apparatus whose control requires rapid starting, stopping and reversing, said system including a reversing

circuit for said motor permitting heavy overloading of the same to provide said control by reversing the current through said motor as required to effect the same, said circuit being characterized in that it includes a conventional reversing controller connected by way of said circuit to control said motor and being characterized in that excessive current surges through said motor during rapid starting, stopping and reversing are prevented solely by means of a reactor inserted in the armature circuit of said motor and providing sufficient reactance to perform said function, whereby to eliminate the need for automatic acceleration switches and the like.

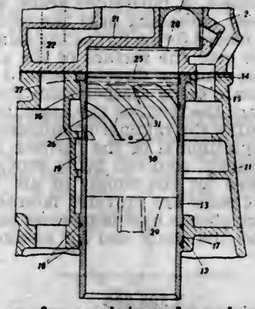
2,106,389
APPARATUS FOR COATING
Irvin J. Paul, Gary, Ind., assignor to American Sheet and Tin Plate Company, a corporation of New Jersey
Application December 13, 1935, Serial No. 54,305
1 Claim. (Cl. 91—50)



In an apparatus for coating flat metals a hard and non-corrodible roll, a resilient and absorptive roll, said first and second named rolls being constructed and arranged to receive the workpiece therebetween and make contact with the same, and a hard and non-corrodible roll for making contact with said resilient and adsorptive roll and applying a coating material thereto, said resilient and absorptive roll comprising a plurality of axially aligned fibrous disks.

2,106,390
STABILIZING CHLORINATED HYDROCARBONS
Whitfield Price, Charleston, W. Va., assignor, by mesne assignments, to Westvaco Chlorine Products Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application July 20, 1936, Serial No. 91,620
14 Claims. (Cl. 23—250)

1. Trichlorethylene stabilized by the presence of a small amount of an alkyl thiocyanate.

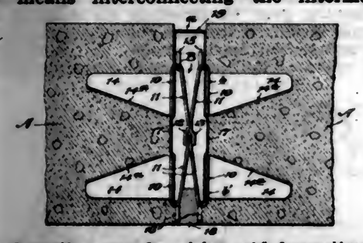


2,106,391
AIR CONDITIONER FOR MOTOR VEHICLES
Paul E. Rice, Lincoln, Nebr.
Application December 19, 1936, Serial No. 116,811
2 Claims. (Cl. 261—29)

1. The combination with the running gear of a vehicle and a body yieldingly supported thereon, of a container, an air filter, an air outlet device within the body and in communication with the container, said container constituting means for holding water and a refrigerant, and means operated by the relative movement of the body and running gear for drawing air through the filter and forcing it through the container to the outlet means within the body, and additional means operated by the relative movement of the

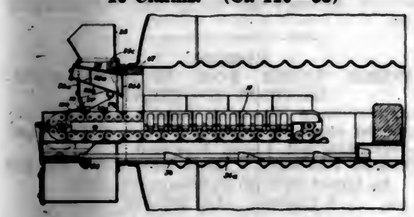
body and running gear for withdrawing water from the container and directing it onto the air circulating within the container, said last mentioned means including a pump having relatively movable members connected to the running gear and body respectively, a tube leading to the pump from the bottom portion of the container, spraying nozzles within the container, and a tubular connection between the pump and the spraying nozzles.

2,106,392
CYLINDER LINER FOR INTERNAL-COMBUSTION ENGINES
Arthur Freeman Sanders, Leeds, England, assignor of one-half to John Fowler & Company (Leeds) Limited, Leeds, England
Application February 6, 1937, Serial No. 124,498
In Great Britain February 19, 1936
5 Claims. (Cl. 309—3)



1. A liner, for an internal-combustion engine cylinder, having secured in its bore, near the axially-outer end thereof, a circumferential hard-wearing metal insert, and having also angularly-spaced inserts secured in the bore and extending axially inwardly of the bore from said circumferential insert.

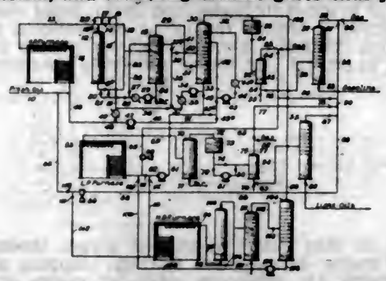
2,106,393
DOWEL MEANS FOR ROADWAY EXPANSION JOINTS
Walter F. Schuh, Youngstown, Ohio, assignor to Truscon Steel Company, Youngstown, Ohio, a corporation of Ohio
Application July 1, 1935, Serial No. 29,354
12 Claims. (Cl. 94—18)



1. Means for connecting road slabs comprising upper and lower cooperating elements of substan-

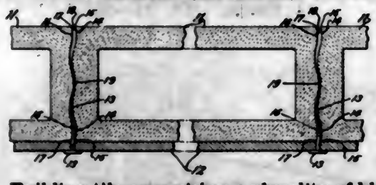
tially M-shape and W-shape formation in cross section, respectively, means for anchoring one side wall of each element to one slab and the other side wall of each element to the other slab, and means interconnecting the intermediate

apical portions produced by said formations between the side walls of the respective elements for relative vertical movement and holding the apices of said formations against relative lateral movement.



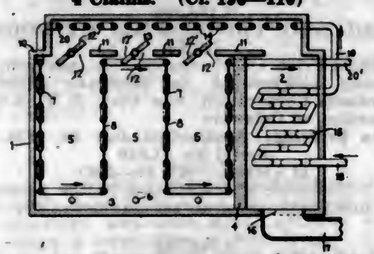
2,108,394
FURNACE GRATE
Lebrecht Steinmüller, Gummersbach, Germany
Application November 30, 1935, Serial No. 52,423
In Austria December 3, 1934
10 Claims. (Cl. 110—33)

4. In a furnace, a horizontal grate, a wedge-shaped rammer extending over the entire width of said grate, means for reciprocating said rammer longitudinally over the surface of the grate, the surface of the rammer directed toward the rear end of the grate being steeper than the surface directed toward the front of the grate, the means for reciprocating the rammer comprising a chain and a rail longitudinal of the furnace on which said chain travels, said rail being provided with lateral recesses for the supply of air, and stationary side cheeks are provided laterally of the chain said side cheeks having recesses for supplying air to cool the chain and for auxiliary combustion air.



2,108,395
HYDROCARBON CONVERSION PROCESS
Frederick W. Sullivan, Jr., Hammond, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application December 30, 1933, Serial No. 704,773
6 Claims. (Cl. 196—9)

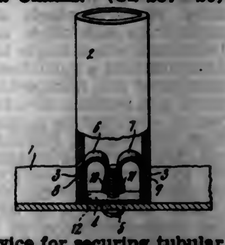
1. A hydrocarbon conversion process comprising subjecting relatively high-boiling hydrocarbon oil to cracking at elevated temperatures and pressures to convert a substantial portion thereof into hydrocarbons of the gasoline boiling range, separating the cracked products into tar and vapors, fractionating said vapors to recover a condensate oil heavier than gasoline and said hydrocarbons of the gasoline boiling range, subjecting said condensate oil in a separate zone to cracking at higher temperatures and relatively low pressures to convert said condensate oil primarily to normally gaseous hydrocarbons of relatively high olefinic content and heavy tarry-like material, and reforming olefinic gases thus pro-



duced to the initial cracking step for conversion into normally liquid hydrocarbons in the presence of said oil.

2,108,396
BUILDING TILE
Arthur C. Van Antwerp, Chicago, Ill., assignor to Eastern Illinois Clay Company, St. Anne, Ill., a corporation of Illinois
Application December 24, 1936, Serial No. 117,424
7 Claims. (Cl. 72—41)

1. Building tile comprising a plurality of blocks arrangeable end to end, the end portions of adjacent blocks being of irregular formation and cooperating to provide sinuous cavities or recesses between said blocks into which nails may be driven to attach a base strip or other member to a wall constructed of such tile, the form of such cavities or recesses causing the nails to be clinched and held against unintended loosening or pulling out.

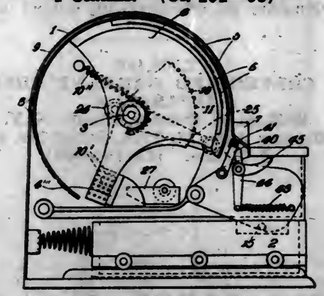


2,108,397
HEATING HYDROCARBON FLUIDS
George W. Watts, Whiting, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application December 27, 1934, Serial No. 759,368
4 Claims. (Cl. 196—110)

4. In an apparatus for heating hydrocarbon fluids, a main heating chamber, a plurality of vertically disposed rows of tubes within said main heating chamber and spaced apart to form a plurality of combustion chambers, at least some of the tubes in the vertically disposed rows being

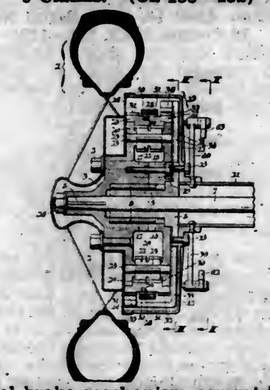
equipped with fins to form a continuous wall, separate means disposed between adjacent rows of tubes for producing hot products of combustion for passage separately through the separate combustion chambers formed by said tubes to thereby heat the tubes forming them preponderantly by radiant heat, means associated with each combustion chamber to form a restricted opening for the passage of products of combustion leaving each combustion chamber, another heating chamber associated with the main heating chamber for receiving hot products of combustion from the combustion chambers, tubes in said last-mentioned heating chamber and means for conducting combustion gases leaving said separate combustion chambers through the restricted openings to said last-mentioned heating chamber.

2,108,398
MOUNTING FOR TUBULAR ARTICLES
William Russell Allen, III, Springfield, Mass., assignor to United American Bosch Corporation, Springfield, Mass., a corporation of New York
Application August 13, 1936, Serial No. 95,825
2 Claims. (Cl. 287—20)



1. In a device for securing tubular articles, the combination of an article having spaced recesses, a securing means comprising a clip having a web portion with a threaded opening therein, expansible arms at the extremities of said web portion having their free ends depending adjacent said threaded opening, lug means on said arms adapted to seat in the recesses of said article, and a threaded member projecting through said web opening and engaging the depending ends of said arms.

2,108,399
MOUNTING DEVICE FOR TUBULAR ARTICLES
William Russell Allen, III, Springfield, Mass., assignor to United American Bosch Corporation, Springfield, Mass., a corporation of New York
Application March 27, 1937, Serial No. 133,323
3 Claims. (Cl. 250—16)



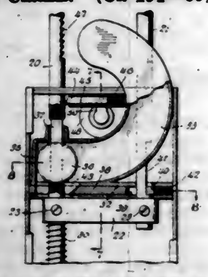
3. In combination, a tubular radio coil form having an inwardly extending flange formed at one end, a support, a mounting element within said form having a central opening therein, a plurality of deformable pins on said element, a shield can enclosing said coil form and having a bottom portion extending under said form, and a screw extending through said support and said bottom portion of said shield can and engaging said mounting element at the central opening thereof, whereby said pins may be caused to pierce said coil form and deform radially.

2,108,400
CASH REGISTER
Harry Barker-Bland, London, England
Application April 21, 1937, Serial No. 138,078
In Great Britain July 30, 1935
4 Claims. (Cl. 101—95)

1. A cash register embodying therein a casing, a manually operable drum mounted in said casing, one arc of said drum having a plurality of finger grips representing different money values respectively accessible from one side of said casing, and an opposite arc upon said drum having complementary money value representations thereon, said casing having a sight opening therein adjacent said last named arc of the drum, means limiting the movement of said drum to a partial revolution coinciding with the arcuate portion thereof having said money representations, a segment having printing characters thereon, connections between said segment and said drum whereby movement of said drum will impart similar simultaneous movement to said printing segment, a printing mechanism associated with said segment, means carrying and actuating a recording strip, a locking member co-operating with said drum to hold it and its printing segment against return movement after they have been set and during the actuation of said printing mechanism, and means whereby said locking member may be released to permit the free rotation of said drum.

2,108,401
WHEEL BRAKE MECHANISM
James V. Crichton, Philadelphia, Pa., assignor of one-half to Karl Salberg, Philadelphia, Pa.
Application October 8, 1936, Serial No. 104,602
9 Claims. (Cl. 188—152)

1. Wheel brake mechanism comprising a plurality of rotatably-free gear pinions circumfer-



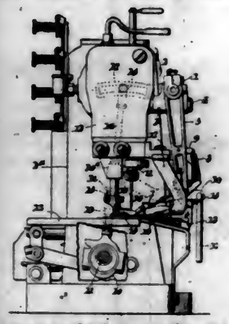
entially arranged about the wheel axis and carried by the wheel; a pair of independently supported juxtaposed toothed gear elements concentric with the wheel axis and meshing with the several pinions; and means operative to exert rotary torque in opposite directions upon the two gear elements in effecting the wheel braking.

2,108,402

COIN CONTROLLED GARMENT CHECKING APPARATUS

William W. Dennin, Albany, N. Y.

Application June 24, 1936, Serial No. 86,945
7 Claims. (Cl. 194—69)



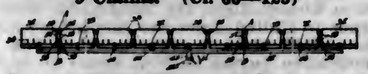
1. In a coin controlled checking apparatus, a casing, cooperating garment locking members carried by said casing, with one of said members slidably supported therein for movements to open and closed positions and including two connected arms having portions projecting from said casing, a movable detent normally engaging one of said arms to prevent closure thereof, a chute for directing a coin into engagement with the other of said arms, the latter arm having means to contact and move said coin into engagement with said detent and move the same to releasing position relative to the first named arm when said arms are moved toward their closing positions, and means to engage one of said arms to releasably retain the same in closed position after said detent has been actuated.

2,108,403

FABRIC MANIPULATING MECHANISM FOR SEWING MACHINES

Russell T. Edwards, Chicago, Ill., assignor to Union Special Machine Company, Chicago, Ill., a corporation of Illinois

Application April 16, 1935, Serial No. 16,593
12 Claims. (Cl. 112—132)



1. Fabric manipulating mechanism for sewing machines, comprising a rock shaft, an arm on said rock shaft carrying a fabric engaging element, an arcuate arm also secured to the rock shaft, an actuating eccentric with a rod having a slidable end pivot connection with the arcuate arm, and a control lever whereby the pivotal connection of the eccentric rod can be shifted along the arcuate arm to vary the throw imparted to the fabric engaging element, said control lever being fulcrumed on a fixed axis and having a sliding connection with the eccentric rod.

2,108,404

MEANS FOR EFFECTING VAPOR TREATMENT OF YARN IN A STRAIGHT KNITTING MACHINE

Henry Janssen, Wyomissing, Pa., assignor to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania

Application October 9, 1935, Serial No. 44,133
9 Claims. (Cl. 66—125)

1. In a multi-section machine for producing knitted fabrics, yarn-receptacle elements disposed a distance from each other, and means for uniting said elements into a single housing structure and for maintaining a yarn-treating medium uniformly distributed and homogeneous throughout the length of said housing structure, including a conduit element constituting passageway means for the medium between the receptacle elements, certain of said elements being arranged for movement relative to each other to compensate for differences in the spacing of the receptacle elements from each other and to effect free distribution and homogenization of the medium throughout the length of said single housing structure.

2,108,405

CLEANING AND POLISHING BLOCK

John J. Kennedy, Los Angeles, Calif., assignor to Chamberlain Co., Inc., Los Angeles, Calif., a corporation

Application August 17, 1935, Serial No. 36,724
5 Claims. (Cl. 51—280)

5. A block of the character described, said block containing coarse aggregate pumice, fine natural pumice, magnesite, and one of a group comprising oxy-chloride cement and oxy-phosphate cement.

2,108,406

TIRE

Herman T. Kraft, Akron, Ohio, assignor to The General Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

Application June 17, 1935, Serial No. 27,922
8 Claims. (Cl. 152—1)

1. A one-piece rubber tire comprising a continuous base, a continuous tread portion spaced therefrom, continuous side walls connecting the side edges of said base with the side edges of said tread portion, and a pair of stabilising webs extending throughout the circumference of the tire and diagonally inwardly from the region of

connection of said side walls with said tread portion and being joined with said base, said stabilizing ribs being spaced apart at said regions of connection of said side walls with said tread portion.

2,108,407

RECEPTACLE AND CLOSURE

William Lockhart, Cleveland, Ohio, assignor to Cornell Securities Corporation, Cleveland, Ohio, a corporation of Delaware

Application May 2, 1935, Serial No. 19,438
7 Claims. (Cl. 220—61)

1. In a clamping device for a metallic receptacle having a bead rolled about its open end and a cover having a flange fitting over the bead, a contractible channeled clamping ring having portions engageable with and pressing the cover flange and bead together when the ring is contracted, and means for contracting the ring including a slotted lever pivotally connected with one end of the ring, a second lever pivoted to said first named lever, and a toggle connecting said levers with the other end of the ring and having a portion operating in the slot of the slotted lever.

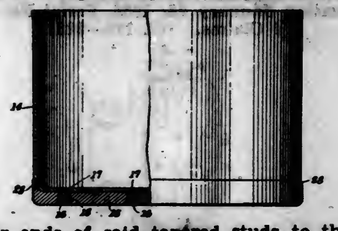
2,108,408

CONTROL DEVICE

Donald H. Mitchell, Chicago, Ill., assignor to Galvin Manufacturing Corporation, Chicago, Ill., a corporation of Illinois

Application March 9, 1937, Serial No. 129,988
5 Claims. (Cl. 116—124.4)

1. A control device for adjustable apparatus including a covered housing having an opening in the front thereof, indicating means visible through said opening including a drum-shaped dial with driving teeth on one rim edge thereof, control means for said device, driving means intermediate said control means and said toothed edges, and resilient means between said dial and said housing to press said teeth into satisfactory driving connection with said driving means.



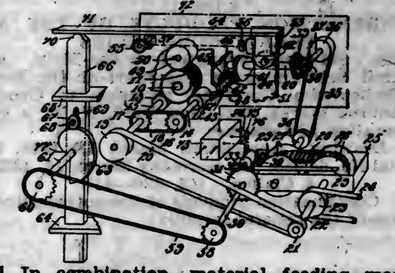
2,108,409

MANUFACTURE OF COOKING UTENSILS

Anthony Peres, New York, N. Y.

Application March 18, 1936, Serial No. 69,424
8 Claims. (Cl. 113—120)

1. The method of manufacturing utensils of the character disclosed, comprising rough punching tapered openings in a heat collector plate, smooth punching said openings to exact tapered size, applying the plate to a pot bottom with the smaller ends of the openings toward the pot, entering tapered studs of substantially the same size in said tapered openings, spot welding the



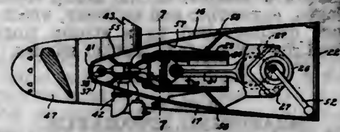
smaller ends of said tapered studs to the pot bottom, chilling the welds to prevent over-heating and distortion of the pot bottom, finishing off the exposed ends of the welded studs flush with the exposed face of the collector plate and finishing the interior of the pot bottom to remove any color traces of the welding heat.

2,108,410

SPEED CONTROL MECHANISM

William B. Perry, Columbus, Ind., assignor to Reeves Pulley Company, Columbus, Ind., a corporation of Indiana

Application March 28, 1932, Serial No. 601,606
13 Claims. (Cl. 242—45)



1. In combination, material feeding means, material take-up means, mechanism including a variable speed transmission connected to drive one of said means, means for varying the output speed of said transmission, light-sensitive means connected to control said speed varying means to vary the angular velocity of said variably-driven means, and means operated by said speed varying means for moving said light-sensitive means.

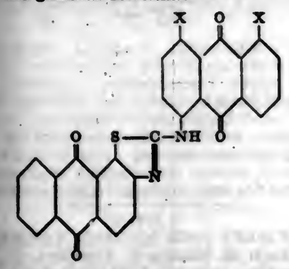
2,108,411

AIRCRAFT AND ENGINE THEREFOR

Hugh M. Rockwell, Freeport, N. Y.

Application July 24, 1933, Serial No. 681,886
5 Claims. (Cl. 244—55)

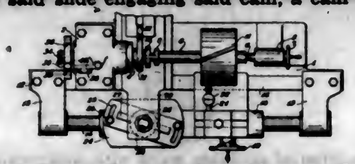
1. In or for an aeroplane, a wing having a deep section and having a portion of its entering edge removed, and an air-cooled internal combustion engine filling the gap left by said removed portion, said engine having a crank case, portions of which are substantially continuous with the upper and lower surfaces of the wing, and having a plurality of parallel cylinders with their head ends facing into the slipstream.



2,108,412
ROTARY HOOK FOR SEWING MACHINES
George Sauer, Berwyn, Ill., assignor to Union Special Machine Company, Chicago, Ill., a corporation of Illinois
Application January 25, 1936, Serial No. 60,766
4 Claims. (Cl. 112—228)

1. In combination, a rotary hook, and a bobbin case about which the hook revolves, the one having a circumferential groove, and the other having a series of small circumferential projections extending substantially all the way around it and engaging the groove with a working fit, said projections being spaced by intervals great enough to materially reduce the friction and heating tendencies of the hook and the bobbin case.

2,108,413
CONDENSATION PRODUCTS OF THE ANTHRAQUINONE SERIES
Heinz Scheyer, Frankfort-on-the-Main, and Emil Schwamberger, Frankfort-on-the-Main-Fechenheim, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application March 13, 1936, Serial No. 68,688. In Germany March 15, 1935
4 Claims. (Cl. 260—44)

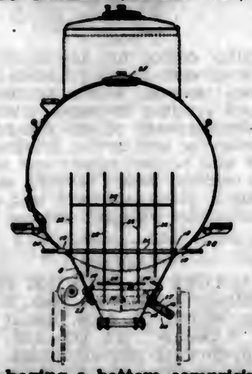


1. Condensation products of the anthroquinone series of the general formula:

wherein one X stands for hydrogen and the other X stands for a member of the group consisting of hydrogen, acylamino and methoxy, which dyestuffs are distinguished by a strong tinctorial power and dye cotton fast reddish shades.

2,108,414
MEASURING APPARATUS
Charles H. Schurr, Cleveland, Ohio, assignor to The Leeds-Bradner Company, Cleveland, Ohio, a corporation of Ohio
Application May 21, 1932, Serial No. 612,853
7 Claims. (Cl. 33—174)

1. Measuring apparatus comprising a base, a spindle journalled in said base, ways on said base parallel to the axis of said spindle, a carriage slidable upon said ways, transverse ways on said base, a slide movable on said transverse ways, a plate cam adjustably secured to said carriage, a follower upon said slide engaging said cam, a cam upon



said spindle, a roller engaging said cam and journalled on said slide, and means maintaining the cam on the spindle in contact with the roller.

2,108,415
MOCCASIN
Louis W. Simister, Astoria, N. Y.
Application March 14, 1936, Serial No. 68,906
1 Claim. (Cl. 36—11)

A moccasin comprising a main blank having a semioval front, a rectangular rear portion and a substantially straight rear edge, said blank having a single row of marginal perforations, a counterblank having a row of perforations corresponding to the perforations in said main blank, an upper blank plurally perforated marginally in conformity with the perforations in the main blank, and a unitary lace passing through all the mentioned perforations and tied at the back, whereby the moccasin is complete.

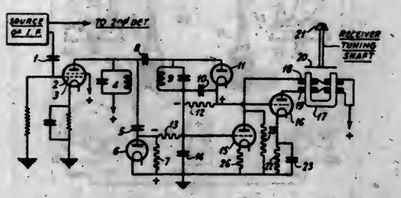
2,108,416
CAR
Abram E. Smith and William H. Runkel, Chicago, Ill., assignors to Union Tank Car Company, Chicago, Ill., a corporation of New Jersey
Application April 10, 1933, Serial No. 665,353
13 Claims. (Cl. 105—247)

1. A car having a bottom comprising a sheet of relatively thick metal, said sheet having an opening therein surrounded by downwardly extending walls integral with said sheet, a hopper having side walls formed in part by said downwardly extending walls of the opening and in part by downward continuations thereof formed of relatively thin sheet metal secured to the relatively thick metal of the bottom sheet, and a closure for said hopper removable to permit withdrawal of the contents of the car and hopper.

2,108,417
AIR ROTOR PARTICULARLY FOR AIRCRAFT
Paul H. Stanley, Glenside, Pa., assignor to Autogiro Company of America, Willow Grove, Pa., a corporation of Delaware
Application August 18, 1934, Serial No. 740,463
16 Claims. (Cl. 244—18)

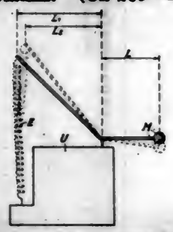
1. An air rotor including an axis member, an aeroform wing member, and means of connection between said members including a plurality of wing pivots, one pivot having its axis lying substantially in a plane containing the rotor axis and another pivot having its axis extending substantially transversely of said plane and located at a point from said rotor axis approximately half the distance from said rotor axis to the extremity of said wing member.

2,108,418
WRAPPED FROZEN CONFECTION
Norman M. Thomas, Brooklyn, N. Y., assignor to Joe Lowe Corporation, a corporation of Delaware
Application February 13, 1933, Serial No. 656,551
3 Claims. (Cl. 99—189)



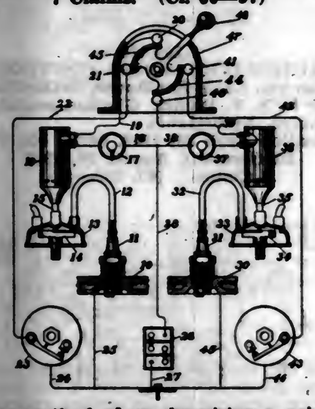
1. As an article of manufacture, a cup adapted to receive an edible confection and made from a blank including an outer edge for defining the mouth of the cup and side edges which are overlapped to form a seam in the cup, said cup being of a conical-like shape so as to enclose an edible cone or the like and being of such length as to extend above the top of the cone so that the upper portion of the cup can serve as a wrapper for ice cream projecting above the top of the cone and which wrapper is adapted to be stripped from the confection to afford access to the ice cream, said upper portion of the cup being aligned with the cone and being of such character and formation as to shape and hold ice cream placed therein and above the cone.

2,108,419
WHIP STOCK
Odie B. Trotter, Houma, La.
Application May 19, 1937, Serial No. 143,469
3 Claims. (Cl. 255—1)



1. A whipstock comprising an upper tapered section and a lowered tapered section, a hinged joint between said sections, said lower section being provided at its bottom forward end with a wedge-shaped projection, the arrangement being such that the projection will tend to penetrate the formation at the bottom of a hole so as to move the lower section forward about said hinged joint to increase the angle of deviation.

2,108,420
AUTOMATIC TUNING CONTROL
Carel Jan van Loon, Eindhoven, Netherlands, assignor to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands
Application April 30, 1936, Serial No. 77,679
In Germany August 20, 1935
8 Claims. (Cl. 250—40)



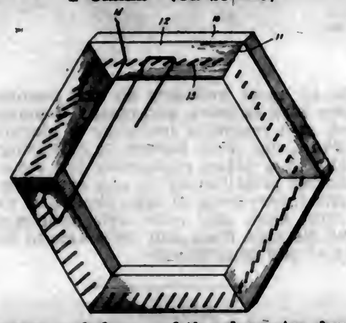
1. In a radio receiver of the type provided with an adjustable tuning mechanism, a resonant circuit tuned to a desired frequency, a rectification network coupled to the resonant circuit and including means for developing a direct current voltage from high frequency energy of said frequency, a second resonant circuit tuned to said frequency and coupled to the first resonant circuit, a second rectification network coupled to the second resonant circuit and including means for developing a direct current voltage from high frequency energy therein of said frequency, and means, responsive to the difference of said two voltages, for controlling adjustment of said tuning mechanism.

2,106,421
GRAVITATIONAL INSTRUMENT
Stephan Baron van Thyssen-Bornemisza, The Hague, Netherlands
Original application September 6, 1934, Serial No. 742,878. Divided and this application October 16, 1935, Serial No. 45,190
In Germany July 9, 1934
3 Claims. (Cl. 265—1.4)

1. In a measuring instrument for the determination of variations of the gravitational acceleration a lever system comprising a beam comprising one part lying substantially horizontal and a second part extending obliquely upwards, a mass attached to the end of the horizontal portion, a spring attached to the end of the obliquely positioned portion, a knife edge upon which the beam is pendulating and a connection for the lower end of the spring.

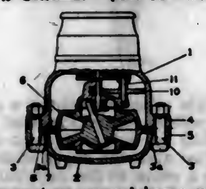
2,106,422
SYNCHRONIZING INTERNAL COMBUSTION ENGINE
Charles K. Woodman, Beverly, Mass.
Application September 28, 1936, Serial No. 102,969
7 Claims. (Cl. 60—97)

1. The method of synchronizing a pair of internal combustion engines, which consists in causing a circuit breaker of one engine to control the ignition of the other engine.



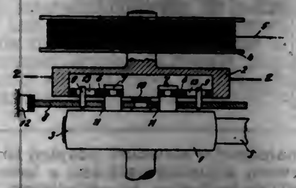
2,106,423
PIPE AND PIPE FILTER
Frank M. Ashley, Great Kills, Staten Island, N. Y., assignor to Lewis Geempers, as trustee
Application January 30, 1936, Serial No. 61,456
4 Claims. (Cl. 131—12)

1. A pipe filter comprising a sheet metal substantially spherical multifingered cap, a stiffening rod, and absorbent material secured to and surrounding said rod, said fingers extending from the equatorial portion of the surface towards one of the poles thereof, the free ends thereof being



in gripping engagement with the filtering material.

2,106,424
TEXTILE FRAME
William T. Bobely, Beverly, N. J.
Application February 16, 1937, Serial No. 125,956
1 Claim. (Cl. 28—15)



A fancy work frame of the character described comprising a hexagonal framework made up of six side pieces, each of which is of an identical construction, each side piece having mitered extremities to facilitate their assembly into a hexagonal formation, means for maintaining the side pieces assembled, and a row of anchoring pins extending along a line which is substantially the median of each side piece, said pins being equidistantly spaced apart and inclined outwardly, there being a pin located at each mitered edge whereby symmetry in the design of the product is afforded.

2,106,425
WATER METER
Robert S. Bassett, Buffalo, N. Y.
Application October 23, 1937, Serial No. 170,622
2 Claims. (Cl. 73—277)

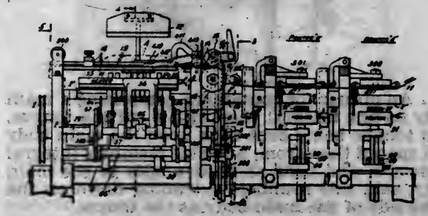
1. A water meter comprising a main outer casing and a breakable bottom casing provided with a securing flange having at the base thereof an internal groove coacting with the outer surface of said bottom casing to form a readily breakable portion, a meter measuring mechanism positively supported by that part of the bottom casing surrounded by said readily breakable portion but automatically released when said portion breaks, and a plurality of pairs of holding means attaching said bottom casing to said main outer casing through said securing flange outside of said readily breakable portion and also engaging said bottom casing on the outer surface of that part of the bottom casing surrounded by said readily breakable portion to restrict the movement of said part when said readily breakable portion breaks; substantially as and for the purpose described.

2,106,426
CLUTCH MECHANISM FOR ELECTROMAGNETIC SOUND RECORDING AND REPRODUCING DEVICES
Semi Begun, Berlin, Germany, assignor to C. Lorenz Aktiengesellschaft, Berlin-Tempelhof, Germany, a company
Application June 6, 1935, Serial No. 25,352
In Germany June 9, 1934
1 Claim. (Cl. 192—43)

In a clutch mechanism for a magnetic sound recording and reproducing machine, a first clutch member coupled to a spool for carrying tape or wire, an intermediate disc continuously maintained under influence of a braking means, a second clutch member connected to a driving shaft, a plurality of jaws fulcrumed on said second clutch member and arranged to cooperate with said first clutch member, means on said disc for controlling the cooperation of said jaw members with said first clutch member, said disc being provided with slots cooperating with means on said second clutch member for limiting the relative movement between said disc and second member.

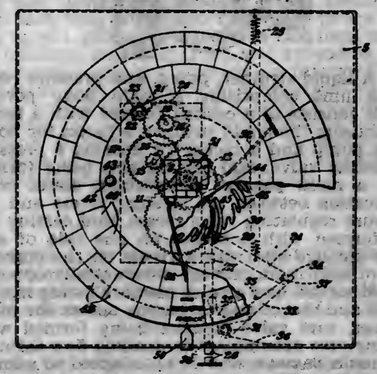
2,106,427
PREPARATION OF ALPHA, BETA UNSATURATED KETONES
Albert Bernard Boese, Jr., Pittsburgh, Pa., assignor to Carbide and Carbon Chemicals Corporation, a corporation of New York
No Drawing. Application May 8, 1936, Serial No. 78,661
11 Claims. (Cl. 260—131)

1. Process which comprises reacting diketene with an aldehyde having at least two carbon atoms in its molecule, and recovering an alpha, beta unsaturated ketone from the resultant reaction mixture.



2,106,428
ELECTRIC SWITCH, PARTICULARLY FOR USE IN CONTROL OF RAILWAY SIGNALS
Andrew Brown, Roland Harris Dunn, and David Gordon McKie, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application September 16, 1936, Serial No. 101,023
In Great Britain September 27, 1935
9 Claims. (Cl. 200—153)

1. An electric switch of the kind referred to comprising a contact part movable by one means, a second contact part movable by a second means, a third contact part movable by both the first and second means and means for closing (or opening) an electric circuit when contacts on all

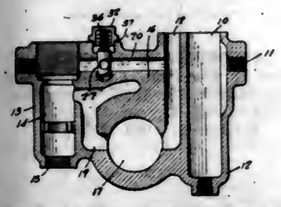


three parts are in a predetermined relative position.

2,106,429
CIGAR-WRAPPING MACHINE
Cesar Bustamante, New York, N. Y.
Application September 28, 1935, Serial No. 42,567
12 Claims. (Cl. 93—2)

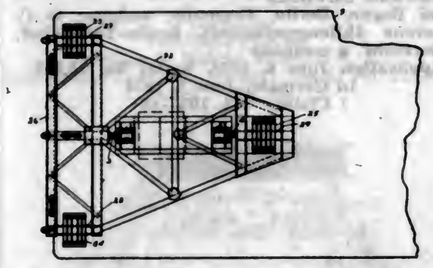
1. In a cigar wrapping machine, a support for a sheet of wrapping material comprising a pair of rods spaced horizontally to receive a cigar between them, means for feeding a length of wrapping material over said rods, a stop adjustable longitudinally with respect to said rods to position a cigar on said wrapping material, means for wrapping said material around said cigar, and a pair of pivoted grippers for sealing the wrapper around the cigar.

2,106,430
AMUSEMENT DEVICE
Clarence F. Cookson, Lyndhurst, N. J.
Application March 28, 1935, Serial No. 13,411
Renewed August 17, 1937
6 Claims. (Cl. 35—8)



1. In combination, a disk, a member movable over said disk, operating means for said member, and an adjustable element having means to coact with means carried by a part of said operating means and control the actuation of said operating means, whereby movement of said member is limited to one of a plurality of definite positions with respect to the surface of the disk.

2,108,421
OPENER FOR CONTAINERS
Edward F. Cornwall, Union Township, Union County, N. J.
Application January 26, 1937, Serial No. 122,355
3 Claims. (Cl. 229—51)



1. An opener for containers, comprising a main body having integral therewith a cutting tongue, said tongue being bent back upon the main body and spaced therefrom, and side members integral therewith and bent at right angles to the main body, said side members extending down on the same side of the main body as the tongue.

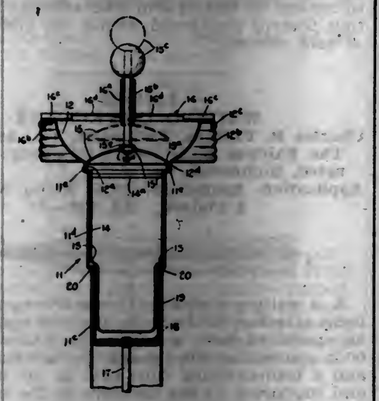
2,108,432
STRAINER, PUMP, AND PRESSURE REGULATING UNIT
Walter Czarnecki, Eddington, Pa., assignor, by mesne assignments, to Eddington Metal Specialty Co., Eddington, Pa., a firm
Application June 1, 1936, Serial No. 82,841
2 Claims. (Cl. 103—41)

1. A liquid strainer, pump, and pressure regulating unit comprising a main body portion which consists of a casting formed with a recess for housing the liquid strainer, a recess for housing a pump and a recess for housing a pressure regulating valve, said casting also being formed with a main passage establishing direct communication between the strainer recess and the pressure regulating valve recess, said casting being formed with a socket on one side of said main passage and with a recess on the opposite side of said main passage substantially opposite to said socket, and a valve member fitting in said recess and socket and extending across the main passage, said valve member being formed with a transverse opening for controlling flow through said main passage, and being adapted to assume different positions whereby communication in said main passage is opened or cut off, as occasion demands, said valve member also being formed with a passageway establishing communication between said transverse opening and the exterior of the casting, and also with a small opening leading into said transverse opening to establish communication between the said main passage and the said transverse opening when flow through said main passage is cut off by said valve member, said last mentioned opening and passageway constituting an air vent.

2,108,433
FLEET TESTING DYNAMOMETER
Vere B. Edwards, Canaopolis, Pa., assignor to Drave Corporation, a corporation of Pennsylvania
Application January 26, 1937, Serial No. 122,389
3 Claims. (Cl. 265—1)

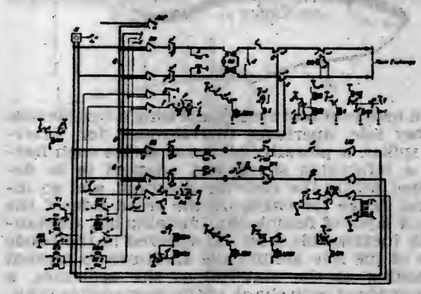
1. A dynamometer structure adapted to be employed between a towing unit and a towed unit, such structure including in association with a dynamometer adapted to be mounted on one of said units, said dynamometer including a member movable in fore-and-aft direction, a pair of bearings adapted to be mounted on the same unit with the dynamometer and spaced apart transversely of the fore-and-aft line through said movable member, a frame including two spaced apart fore-and-aft extending members which members are mounted in said bearings and are movable therein in fore-and-aft direction, the said frame being adapted to engage the said movable member of the dynamometer, said frame also including a member extending transversely of such fore-and-aft line and adapted to be engaged by the other of the two units first named.

2,108,434
OPERATING MECHANISM OF VEHICULAR TOYS
Masakichi Fujii, Nippori Machi, Arakawa Ku, Tokyo, Japan
Application December 22, 1936, Serial No. 117,118
In Japan December 27, 1935
3 Claims. (Cl. 46—212)



1. Operating mechanism of vehicular toys, which comprises a movable body, a spring motor provided therein, one of the rear wheels of the vehicle being rotated for forward movement by said motor, a normally inoperative reversing wheel, the other rear wheel being mounted freely upon a crank shaft separated from said first-named rear wheel, a bumper provided in front of said movable body and a transmission mechanism connected with said bumper and adapted for liberating the above crank shaft, the wheel on the crank shaft being lifted from a floor through the transmission mechanism when the movable body strikes against an obstacle so that the reversing wheel is brought into contact with the floor.

2,108,435
FAN
Harold F. Hagen, Dedham, Mass., assignor to B. F. Sturtevant Company, Hyde Park, Mass., a corporation of Massachusetts
Application June 12, 1935, Serial No. 26,138
4 Claims. (Cl. 230—132)



1. A fan rotor having blades and supporting means therefor, the blades being offset rearwardly with respect to the direction of rotation to strengthen the blades and to form a recess extending the radial depth of the blades and occupying a substantial portion of the axial length thereof, and plates affixed in said recess by welding along the inner and side edges to afford an uninterrupted driving face, said plates forming replaceable driving faces in the zones of the blades subject to substantial erosion.

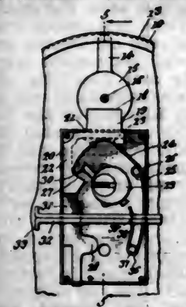
2,108,436
ASH RECEIVER
Charles Hardy, New York, N. Y.
Application August 1, 1935, Serial No. 34,159
4 Claims. (Cl. 131—51)

1. An ash receiver comprising a base, an upright and a top hopper all united together to form a stand of fixed parts, the top of said upright defining a compartment directly communicating with the open bottom of said hopper, a separate ash receiving receptacle seated in said compartment and adapted to be lifted through the opening of said hopper for dumping the ash contents accumulating in said receptacle, a closure element normally closing the communication and manually movable upwardly to open the communication between the hopper and the said compartment, and mounting means for said closure element bridging the top of said stand, the said mounting means and movable closure element being constructed and arranged relatively to said fixed hopper and communicating compartment to permit the said lifting of the separate ash receiving receptacle through the opening of said hopper for the dumping of its contents.

2,108,437
AUTOMATIC TELEPHONE SYSTEM
Alfred Heyduck, Berlin-Nowenhagen, Germany, assignor to Mix & Genest Aktiengesellschaft, Berlin-Schoneberg, Germany, a company
Application November 23, 1935, Serial No. 51,252
In Germany November 28, 1934
6 Claims. (Cl. 179—18)

1. In a branch exchange system having local lines, outside trunks, common local trunks accessible to any of said local lines for establishing the connections from one local line to another, outside-trunk switching apparatus for establishing connections from a local line to an outside trunk and first discriminating means normally effective to associate said outside-trunk apparatus with a calling local line in response to the grounding of the calling local line, the combination which comprises an intermediate-call line, second discriminating means responsive to a grounding of the calling line after the establishment of a first connection to a first outside trunk for temporarily disabling said connection and initiating an intermediate-call connection over said intermediate-call line and over one of said local trunks; other means responsive to a later grounding of the calling line during the intermediate-call connection for releasing said intermediate-call connection and resuming said first connection and third discriminating means associated with said local trunk and responsive to the setting up of a particular number in said local trunk for releasing said local trunk and grounding said intermediate-call line whereby an intermediate-call from said calling branch exchange station over a second outside trunk is established by the actuation of said first discriminating means without actuating said second discriminating means so as to resume the previously established connection to said first outside trunk.

2,108,438
PROCESS OF TREATING HYDROCARBON VAPORS WITH ZINC CHLORIDE
Franklin E. Kimball, Los Angeles, Calif.
No Drawing. Application July 21, 1936, Serial No. 91,788
9 Claims. (Cl. 196—36)

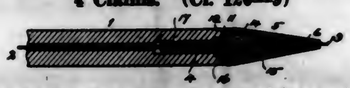


3. In the refining of hydrocarbon vapors, at a temperature between 355 degrees Fahrenheit and zinc chloride fusion-temperature, the step which comprises passing the vapors beneath the surface of a fused maintained treating-mixture containing sufficient ammonium chloride to prevent separation of zinc chloride and sufficient zinc chloride to prevent separation of ammonium chloride.

2,108,439
SPIKED SHOE
Leslie H. L'Hollier, Waltham, Mass., assignor to Hood Rubber Company, Inc., Watertown, Mass., a corporation of Delaware
Application December 16, 1936, Serial No. 115,201
1 Claim. (Cl. 36—7.6)

An article of footwear comprising a thin flexible rubber sole, apertures therethrough for receiving spikes, a plurality of metal spikes each having a bifurcated shank end adapted to be deformed within the shoe for clinching, and an integral flange for engaging the tread side of the sole, a layer of flexible non-metallic but substantially inextensible material adhered to the inside face of the sole around the apertures to prevent spreading of the material at the apertures, a washer about each shank at the inextensible layer, said washer, inextensible layer and sole being held clamped against said flange by the clinched end of the shank, and an insole at least substantially equal in thickness to the washers and the clinched ends of the shanks so as to present a substantially flush insole surface, said insole being adhered to the sole within the shoe, and clearance openings to receive the washers.

2,108,440
LOCKING DEVICE FOR MAIL RECEPTACLES
Thomas F. Murphy, New York, N. Y.
Application October 1, 1936, Serial No. 103,590
7 Claims. (Cl. 70—240)

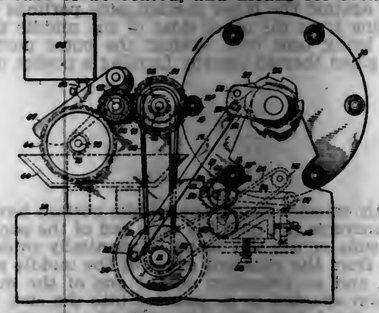


2. A locking device for mail receptacles, comprising knob actuated holding means adapted to be secured to the door of a mail receptacle for maintaining the same closed, a locking bolt mounted on the inner side of the door in proximity to said device and biased into interlocking engagement with the device when the latter is in door holding position, an individual key receiving member carried by the door operable on said bolt to retract the same and release said device by insertion and operation of a predetermined key, a master key receiving element mounted on the door in proximity to the bolt for receiving and supporting a master key, means on the bolt adapted to be engaged by the master key for engaging and retracting the bolt, and a releasable latch bar carried upon the inner side of the door for interlocking engagement with the bolt when retracted by either of said key devices and adapted to be manually released for freeing the bolt for cooperation with the holding device.

2,108,441
PENCIL
Hans Mauscher, New York, N. Y.
Application September 28, 1936, Serial No. 103,071
4 Claims. (Cl. 120—14)

3. For use in a mechanical pencil, a lead holder comprising two coaxial sleeves, one of which surrounds the other, and said sleeves being relatively rotatable but fixed axially, the inner of said sleeves having a bore the diameter of which is substantially the same as that of a lead positioned therein, and each of said sleeves having a spiral slot in the walls thereof, said spiral slots being of opposite and unequal pitch, and a lead propelling member within the inner sleeve adapted to engage an end of said lead and having a portion thereof positioned within the slots of both of said sleeves.

2,108,442
WRITING INSTRUMENT
Charles H. Phillips, Richmond, Va., assignor to The Fairway Real Estate Company, Incorporated, Richmond, Va.
Application August 19, 1936, Serial No. 96,730
4 Claims. (Cl. 120—9)

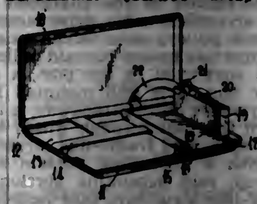


3. A writing instrument: comprising a stem; a point attached to the stem; the said point having an apertured base, a hollow tip, and a resilient body connecting the tip and the apertured base; and a lead-carrying tube held in the hollow tip and supported in the aperture in the base.

2,108,443
COLLAPSIBLE TUBE ENAMELING MACHINE
Walter Prussing, New York, N. Y., assignor to Vieter Metal Products Corporation, Brooklyn, N. Y., a corporation of New York
Application April 12, 1934, Serial No. 720,170
5 Claims. (Cl. 91—50)

1. In a machine for preparing a collapsible metal tube for the printing of indicia thereon, means including a first roller of length less than the length of said tube for applying colored opaque coating material to the entire cylindrical surface of one part of said tube, means spaced from said first-mentioned means and including a second roller of length less than the length of said tube and of a length equal to the remaining length of the cylindrical surface of said tube for applying separate transparent coating material capable of being imprinted with indicia to the entire cylindrical surface of the remaining

part of said tube, means including a single rotatable turret for moving said tube between the aforesaid coating applying means, means for adjusting the position of said second roller relatively to a tube to be coated, and means for rotating

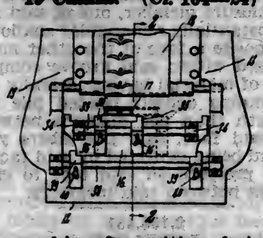


said second roller including a plurality of gears carried by the adjusting means, and a swingable gear mounted independently of the adjusting means and in driving contact with one of the plurality of gears in all positions thereof.

2,108,444
ENAMELED PLAQUE AND METHOD OF MAKING SAME
Alfred F. Reilly, North Attleboro, Mass., assignor to Evans Case Company, a corporation of Massachusetts
Application October 2, 1935, Serial No. 43,339
3 Claims. (Cl. 41—22)

1. In an article of the class described, in combination, a metal plate having a design in relief formed thereon, said plate being engine turned, and a coating of enamel on said plate, the surface of said plate having areas of varying depths to produce said design whereby a varying shading effect is imparted by said enamel over said areas.

2,108,445
RECEPTACLE
Alfred F. Reilly, North Attleboro, Mass., assignor to Evans Case Company, North Attleboro, Mass., a corporation of Massachusetts
Application May 21, 1937, Serial No. 144,066
11 Claims. (Cl. 206—41.4)

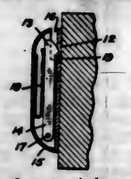


1. A receptacle comprising two members hinged together, a lighter carried by one member, means on said member for holding the lighter at approximately 90° to the member, and a curved spring on the other member to engage the lighter and cause it to be substantially parallel to the first member as the receptacle closes.

2,108,446
REFLECTOR DEVICE
Oliver C. Ritz-Woller, Chicago, Ill.
Application January 19, 1935, Serial No. 2,479
9 Claims. (Cl. 88—82)

1. In a device of the type described, the combination of a casing member having an opening in its front wall portion, a lens having a forwardly tapered portion extending through said opening, a member of yielding resilient material surrounding the forwardly tapered portion of said lens and compressed edgewise of the wall between the tapered portion of the lens and the edge of the wall surrounding said opening when said lens and said resilient member are pressed forwardly, and means for holding said lens yieldingly in position and for tightly closing the casing in rear of the lens for preventing the entrance of water and comprising a comparatively thick pad of yielding resilient material in rear of said lens adapted when pressed forwardly to apply forward pressure on said lens and said resilient member and adapted under normal conditions to permit a substantial backward yielding movement of said lens, and means for holding said pad compressed for normally applying forward pressure on said lens and said resilient member so as to hold said resilient member also compressed.

2,108,447
PERFORATING MACHINE AND METHOD OF OPERATING THE SAME
Stig E. Rosenberg, Brockton, Mass.
Application January 15, 1936, Serial No. 59,233
10 Claims. (Cl. 164—24)



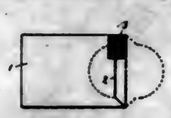
1. In a machine for cutting designs in shoe uppers or the like, a cutting die, a backing strip for the work above said die, means for causing said die to cut upwardly against said strip, means for feeding said strip after each cutting operation, and means for laterally adjusting the operating position of said die.

2,108,448
PURIFICATION OF NAPHTHENIC ACIDS
John T. Rutherford, Berkeley, Calif., assignor to Standard Oil Company of California, San Francisco, Calif., a corporation of Delaware
No Drawing. Application July 3, 1933, Serial No. 678,996
3 Claims. (Cl. 260—108)

1. The process of purifying naphthenic acids which comprises treating crude naphthenic acids with a strong sulfuric acid in the presence of a water-immiscible diluent more volatile than the naphthenic acids and relatively inert to sulfuric acid and separating the sulfuric acid sludge, saponifying the treated acids with aqueous alkali in the presence of the diluent, separating the diluent phase, and acidifying the aqueous naphthenate solution with a mineral acid.

2,108,449
HOLDER FOR STRING
Joseph M. Sapunar, San Mateo, Calif.
Application January 29, 1936, Serial No. 61,396
2 Claims. (Cl. 242—144)

2. In a holder for a string, a housing having an aperture therein, a latch pivotally mounted within said housing, a projection on said latch, yieldable means normally urging said latch into a position in which said projection extends into said aperture, and a longitudinal slot in said housing in substantial registry with said projection and said aperture permitting insertion of a string between said latch and said aperture, said string being fed through the holder laterally with respect to said latch.

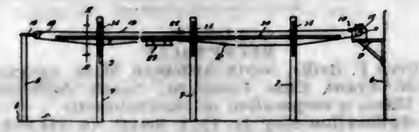


2,108,450
CLOSURE AND WEATHER STRIPPING THEREFOR
Charles P. Schlegel, Rochester, N. Y., assignor to The Schlegel Manufacturing Company, Rochester, N. Y., a corporation of New York
Application April 12, 1935, Serial No. 16,053
6 Claims. (Cl. 20—69)

1. In a device of the class described, a frame member, a closure member, one of said members having a substantially rectangular shallow groove disposed opposite a face of the other member, a weather guard within said groove comprising a woven strip of material having laterally and outwardly extending densely related pile fibers of greater length than the distance between said strip and said face, said pile fibers yieldingly engaging and being deflected by said face whereby to exert pressure on said face to effectively seal the joint between said members.

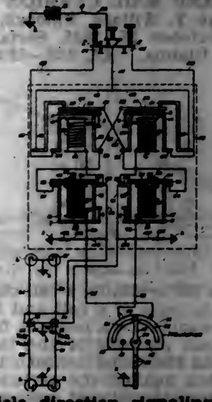
2,108,451
ENVELOPE
Leonid L. Selesneff, New York, N. Y.
Application March 18, 1937, Serial No. 131,665
In France October 17, 1936
1 Claim. (Cl. 229—84)

An envelope consisting of a sheet of paper having a rectangular middle portion, an inner and an outer end portion extending from the opposite sides of the middle portion and being of substantially the same size as the middle portion, the inner portion being bent over against the middle portion, the outer portion being bent over against the inner portion, side portions extending from the other sides of the middle portion being bent over against the outer portion and glued thereto thereby forming a pocket uni-



formly smooth inside, the middle portion having a transverse slot near the open end of the pocket, the ends of the slot being substantially equidistant from the adjacent edges of the middle portion, and an extension on the end of the outer portion adapted to be inserted into the slot, the extension being cut at an angle of approximately 45° from its base to the point of entrance into the slot, the rest of the extension being of a semicircular shape.

2,108,452
CELLULOSE MIXED ESTER COMPOSITIONS CONTAINING HIGHER FATTY ACID ESTERS
Henry B. Smith, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
No Drawing. Application May 16, 1934, Serial No. 725,955
7 Claims. (Cl. 106—40)

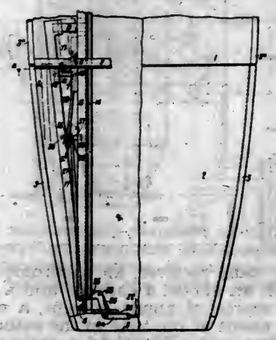


1. A transparent, flexible sheet comprising 100 parts by weight of a cellulose mixed ester of fatty acids containing less than 1.5 esterifiable hydroxyl groups per 24 carbon atoms of the cellulose radical, and, as a plasticizer therefor, from 5 to 25 parts by weight of an ester of a fatty acid of from 12 to 18 carbon atoms with a monohydric alcohol of from one to four carbon atoms.

2,108,453
MAIL CARRIER
Guy Spencer, Heyworth, Ill.
Application February 6, 1937, Serial No. 124,491
1 Claim. (Cl. 104—177)

An article carrier of the character described comprising an endless cable, drive means for said cable, spaced pulleys over which the cable is trained, supporting means for said pulleys, a post, a trackway supported by the post, a receptacle attached to the cable and mounted for longitudinal movement on the trackway, a frame-like structure on the post through which the receptacle is movable, said frame-like structure being provided with a depending portion supporting the trackway, said depending portion provided with a loop-like structure, said loop-like structure serving as a guide for one flight of the cable, and anti-frictional means in the said loop-like structure for said cable.

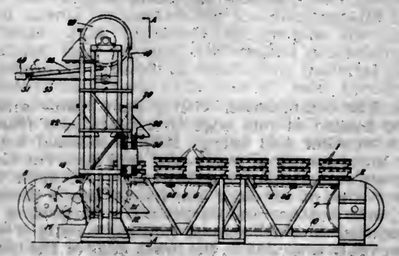
2,108,454
SIGNALING DEVICE FOR VEHICLES
Louis Edward Stedman, Cincinnati, Ohio
Application March 8, 1934, Serial No. 714,616
19 Claims. (Cl. 177—339)



1. A vehicle direction signaling means comprising in combination a steering gear controlled switch, a left turn signal initiating switch and a right turn signal initiating switch both within the reach of an operator of the vehicle, a left turn signal device and a right turn signal device supported upon the vehicle for indicating to persons other than the operator the operator's intention to steer the vehicle from a straight course, a source of electricity, electrical circuit means including the source of electricity and the signal initiating switches, and the signal means, and electrical devices included in said electrical circuit means for energizing said signal means alternately upon alternate momentary closing of the signal initiating switches in all positions of the steering gear controlled switch and for maintaining said signal means alternately and separately energized during the entire period between alternate circuit closing actuations of said signal initiating switches, and an electrical circuit including the steering gear controlled switch for de-energizing the signal means upon completion of an indicated turn.

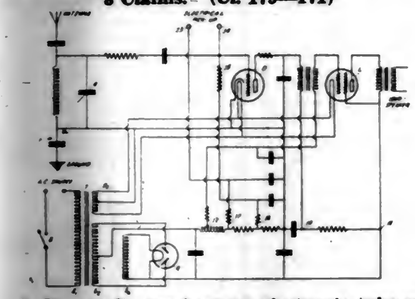
2,108,455
PROCESS FOR RENDERING A TEXTILE MATERIAL RESISTANT TO MOISTURE
Herbert G. Stone, Kingsport, Tenn., and Carl J. Malm, Rochester, N. Y., assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
No Drawing. Application March 31, 1934, Serial No. 718,516
6 Claims. (Cl. 91—68)

1. A process for rendering a textile material resistant to moisture which comprises thoroughly wetting the material with a substantially neutral aqueous solution of a water-soluble salt of a cellulose ester containing a dicarboxylic acid radical and then regenerating the cellulose ester.



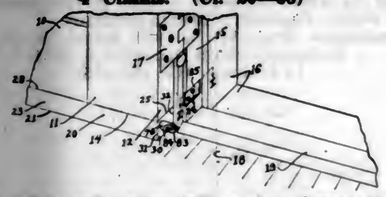
2,108,456
AUTOMOBILE BODY
Norman Aubrey Delano Thompson and John William Fagan, London, England, assignors to Park, Ward & Company Limited, London, England
Application May 27, 1936, Serial No. 82,010
In Great Britain July 23, 1935
9 Claims. (Cl. 296—99)

1. In a structure of the character described, windshield posts, and an auxiliary roof portion comprising a peak rail, a panel hinged to the peak rail at its forward end, a bar extending longitudinally adjacent the undersurface of the panel, a ramp slidably mounted on the bar for raising and lowering the rearward end portion of the panel, a cantrail, a toggle mechanism secured to the cantrail and to the longitudinally extending bar for extending and retracting the



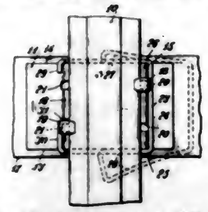
cantrail, locking means for engaging the auxiliary roof portion with the windshield posts and for disengaging it therefrom, and means comprising a control crank mounted on the peak rail, a bell crank, a rod connecting the control crank and the bell crank, and a rod connecting the bell crank and the toggle mechanism for simultaneously actuating the ramp, the toggle mechanism, and the locking means.

2,108,457
APPARATUS FOR AUTOMATICALLY FEEDING METAL PIGS
Vincent Tobia, Chandlers Ford, England, assignor to Pirelli-General Cable Works Limited, London, England, a British company
Application December 4, 1935, Serial No. 52,795
In Great Britain December 8, 1934
16 Claims. (Cl. 198—35)



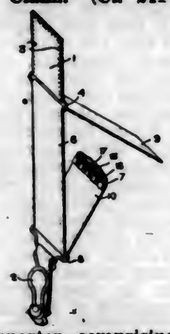
16. Apparatus for the automatic delivery of metal pigs, comprising in combination a conveyor in co-operative relationship with an elevator, a series of tables on said conveyor for the reception of groups of pigs, each of said tables being revoluble about an axis at right angles to its supporting surface, and means in operative association with said elevator for intermittently rotating the table for the time being in operative relationship with said elevator about its axis through a right angle.

2,108,458
RECEIVER
Jacob Marinus Unk, Eindhoven, Netherlands, assignor to Radio Corporation of America, a corporation of Delaware
Application August 8, 1929, Serial No. 383,243 Renewed April 6, 1936. In Germany August 28, 1928
8 Claims. (Cl. 179—171)



1. In a radio receiver, an electronic tube provided with an anode, a cathode and a grid electrode, a source of anode current, a connection from the anode of the tube to the cathode thereof including said source and a resistor element in series, a connection from the grid of the tube to the cathode thereof, said connection including a portion of said resistor whereby the included portion of the resistor is both in the grid and plate circuits of the tube, a pair of terminals for connection of an electrical pick-up device, a direct connection from one of said terminals to the grid of the tube and a direct connection from the other of said terminals to the cathode of said tube said last named connection also including at least a portion of said resistor.

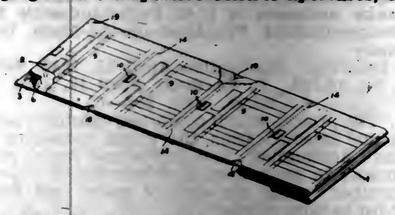
2,108,459
WEATHER AND CARPET STRIP
Laurence E. Voorhees, Washington, D. C.
Application May 10, 1937, Serial No. 141,832
4 Claims. (Cl. 20—68)



1. The combination with a door frame and a door hinged at one edge thereof to said frame, of a weather and carpet strip positioned below the lower marginal portion of said door for closing substantially the entire space between the lower edge of the door and its subjacent threshold, said weather and carpet strip comprising an elongated channel-shaped housing having a web removably attached to the lower edge of the lower marginal portion of said door and upwardly disposed with respect to flanges perpendicular to said web and spaced so as to be flush with corresponding faces of the door, an elongated channel-shaped sealing drop having a web downwardly disposed with respect to flanges perpendicular to said web and spaced so as to permit the drop to freely telescope into projected and retracted positions within said housing, means for projecting the sealing drop out of the housing when the door is closed and thereby bringing the lower sealing strip thereof into yielding engagement with its subjacent threshold, and means for retracting the sealing drop within the housing when the door is opened.

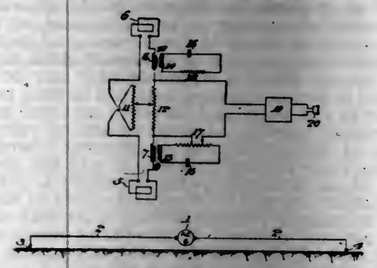
2,108,460
TIE PLATE AND RAIL CUSHION RETAINER
George T. Willard, Chicago, Ill.
Application October 25, 1935, Serial No. 46,710
17 Claims. (Cl. 238—283)

11. A device for retaining a rail cushion member between the base of a rail and the top face of a tie plate comprising a resilient frame adapted to seat upon portions of the tie plate and having portions extending beneath the rail base adapted to abut against the vertical edge portions of the tie plate and said cushion member.



2,108,461
HOSE SUPPORTER
Diana P. Williams, Boston, Mass.
Application November 27, 1936, Serial No. 112,930
1 Claim. (Cl. 241—3)

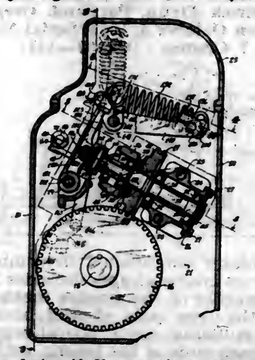
A hose supporter comprising a non-elastic upper section adapted to be sewed to a corset or other supporting garment, a metal loop permanently secured to said upper non-elastic portion, a hose-gripping member having at its upper end a second metal loop, a length of elastic webbing extending loosely through and being detachable from both metal loops, and a buckle separate from each metal loop and secured to one end of the webbing, said buckle having a slot through which the other end of the webbing extends, and a gripping member for gripping the latter end of the webbing, said gripping member being located on the inside of the webbing and the outer face of the buckle below the slot being covered by the webbing.



2,108,462
CONTINUOUS MANIFOLDING STRIP SUPPLIES
William J. Wiswall, Portland, Oreg., assignor, by mesne assignments, to American Sales Book Company, Inc., a corporation of Delaware
Application January 22, 1929, Serial No. 334,262
35 Claims. (Cl. 282—12)

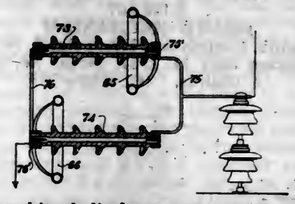
1. A manifolding, recording pack of the character described including, in combination, a composite traveler work-web including a plurality of relatively superposed strips and having a longitudinal series of strip-control apertures, and strip-aligners carried by the work-web and engaging in the respective control apertures, each

of said strip-aligners being composed of a single integral sheet member, said aligners loosely threading through said apertures of the intermediate strip or strips of said work-web and being fast to the upper and lower strips thereof.



2,108,463
APPARATUS FOR ELECTRICAL PROSPECTING
Theodor Zuschlag, West Englewood, N. J., assignor to Hans T. F. Lundberg, Montreal, Quebec, Canada
Application June 25, 1936, Serial No. 87,230
4 Claims. (Cl. 175—182)

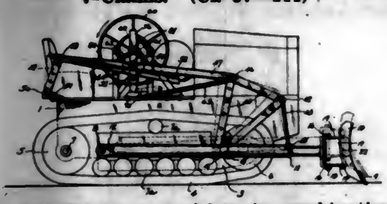
1. Apparatus of the character described comprising, a plurality of pick-up coils, a plurality of potentiometers, and a plurality of phase transformers, said elements being electrically connected in such a way that current induced in the coils produces a potential across the potentiometers and energizes the transformers, and the sliders of said potentiometers being connected with each other and movable in such a way that the impedance of each of the two coil circuits as a whole remains constant.



2,108,464
ENGINE GOVERNOR
Anker K. Antonsen, Beloit, Wis., assignor to Fairbanks, Morse & Co., Chicago, Ill., a corporation of Illinois
Application December 28, 1935, Serial No. 56,439
6 Claims. (Cl. 264—3)

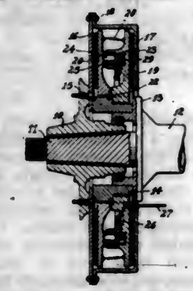
1. In a governor assembly of a type including centrifugally movable speed responsive members, a governor shaft and means for rotating said shaft to actuate said members, an element displaceable along the axis of the shaft in response to movement of the centrifugal members, a lever operatively associated with the displaceable element, a spring connected to the lever in a manner to oppose speed responsive movements thereof, a manual control member for swinging said spring to vary the angle and effective loading thereof with respect to the lever, and through a range of positions including both zero degrees and ninety degrees to the lever, an auxiliary

spring of substantially constant effective loading on the centrifugal members, and means for varying the inherent loading of the spring, in the different positions of the control member.



2,108,465
SURGE ARRESTER
Arthur O. Austin, near Barberton, Ohio, assignor, by mesne assignments, to The Ohio Brass Company, Mansfield, Ohio, a corporation of New Jersey
Application May 12, 1932, Serial No. 610,849
20 Claims. (Cl. 175—30)

7. A combined discharge gap and arc clearing device comprising a dielectric member having a passage therethrough, spaced discharge terminals for directing a discharge through said passage, and means for controlling the electrostatic field between said terminals to initiate discharge through said passage, said means comprising a capacitance member of conducting material electrically connected with one of said terminals and disposed adjacent said passage but separated therefrom by said dielectric member and having one extremity thereof located in a plane normal to the axis of said tube between the adjacent extremities of said discharge terminals, said passage having an opening to atmosphere to permit exit of a blast for extinguishing the arc formed by a discharge between said terminals and being of sufficient length that the blast caused by said discharge will extinguish the arc thus formed at the operating conditions for which said device is designed.

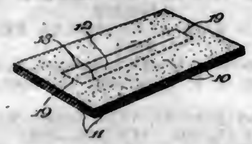


12. In an insulating device, two conducting elements shaped to provide non-uniform potential gradients over the surfaces thereof, and insulating means separating said elements, said elements being arranged so that the maximum gradient point of each of said surfaces lies in a line of electrostatic force which terminates at a region of low potential gradient at the other of said surfaces.

2,108,466
BULLDOZER
George S. Allin, Seattle, Wash., and Theodore Patrick Flynn, Portland, Oreg.
Application October 4, 1935, Serial No. 43,518
7 Claims. (Cl. 37—144)

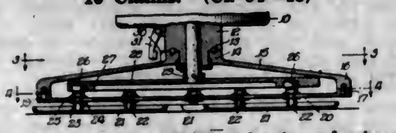
1. A bulldozer comprising, in combination, a tractor, thrust beams at opposite sides of and extended forwardly of the tractor means pivotally attaching the rear ends of said beams to the tractor, a bulldozer blade operatively mounted by the forward ends of the beams, rocker frames pivotally mounted on the tractor adjacent the forward ends of the thrust beams, links connecting the rocker frames with their corresponding thrust beams for raising or lowering the latter, a rocker shaft mounted across the rear of the tractor, lever arms fixed thereto, links connecting said arms and the rocker frames for actuating the latter, a rack bar operatively connected with an arm of the rocker shaft, a hand wheel, a pinion gear in mesh with the rack bar and operated under control of the hand wheel to actuate the rocker shaft.

2,108,467
BRAKE MECHANISM
Adolph Backstrom, Hempstead, N. Y.
Application May 11, 1937, Serial No. 141,897
4 Claims. (Cl. 188—72)



1. In a brake mechanism, a brake-drum, brake-shoes movable axially from a normally inactive position out of braking contact with said brake-drum to an active position wherein braking contact between said brake-shoes and said brake-drum is maintained, one said brake-shoe being rotationally fixed and the other said brake-shoe being loosely mounted whereby free relative circumferential movement between it and said first mentioned brake-shoe is induced once contact between the loosely mounted brake-shoe and the brake-drum is established, means responsive in its operation to relative circumferential movement of said loosely mounted brake-shoe adapted to automatically progressively intensify the braking pressure once said brake-shoes are rendered active, and means interposed between said brake-shoes and completely housed within said brake-drum adapted to render said brake-shoes active or inactive at will.

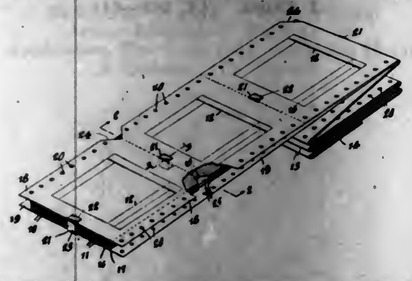
2,108,468
PREPARATION OF HIGH MOLECULAR SULPHUR CONTAINING PLASTICS
Wilhelm Becker, Cologne-Mulheim, and Ludwig Orthner, Frankfort-on-the-Main, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application April 15, 1935, Serial No. 16,534. In Germany April 18, 1934
8 Claims. (Cl. 260—6)



1. The process which comprises causing a polysulphide selected from the group consisting of alkali-, ammonium- and earthalkali metal polysulphides to react upon 2-chloroethyl-2'-chloroethylether in the presence of water and finely divided barium sulphate.

2,108,469
PROTECTOR PAD FOR PERMANENT HAIR WAVING
Harry Bonat, New York, N. Y.
Application April 17, 1936, Serial No. 75,025
1 Claim. (Cl. 132—36.1)

A scalp protective element of the character described comprising a pad composed of two superimposed sheets of flexible material secured together, said pad having an elongated slit therein through which a strand of hair may be inserted to permit disposing said pad in close proximity to the scalp, said sheets of material being connected together adjacent to and on opposite sides of the slit by rows of stitching extending in the same general direction of said slit, and a pair of spring members of substantially U-shaped formation disposed between said sheets of material in opposite relation to each other with their leg portions disposed in straddling relation to said rows of stitching for yieldingly urging the edges of the slit toward each other.



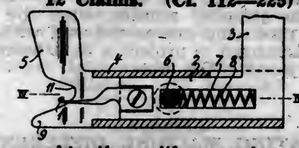
2,108,470
FLOOR TROWELING MACHINE
Harold S. Boulton, Chicago, Ill.
Application December 28, 1936, Serial No. 117,843
10 Claims. (Cl. 94—45)

1. In combination, a frame having a horizontal member providing a slot, a trowel plate having a portion projecting through said slot, a motor, a plate having a cam groove secured to the motor shaft, the upwardly projecting portion of the trowel stud engaging said groove.

2,108,471
COMPOSITE TRAVELER RECORD FASTENER
Archie Minor Bovier, Elmira, N. Y., assignor to American Sales Book Company, Inc., Niagara Falls, N. Y., a corporation of Delaware
Original application October 14, 1931, Serial No. 568,702. Divided and this application June 5, 1936, Serial No. 83,723
7 Claims. (Cl. 282—12)

1. A manifolding pile comprising a plurality of superposed continuous record strips and interleaved transfer strips having transverse lines of severance, located at sheet-length intervals along the pile along which the strips may be severed, into sets of superposed record and transfer sheets; and means located on the lines of severance for holding the strips in registration in the pile until the pile is severed, said means being biased to yieldingly engage and hold the sheets of a severed set together against casual separation but permitting intentional removal without mutilating or tearing any portion of any sheet.

2,108,472
TRAY FASTENING DEVICE
John J. Brassil, Baldwinsville, and Cornelius A. Brosnan, Worcester, Mass., assignors to E. L. Thompson Chair Corporation, Baldwinsville, Mass., a corporation of Massachusetts
Application November 21, 1936, Serial No. 111,998
3 Claims. (Cl. 155—127)

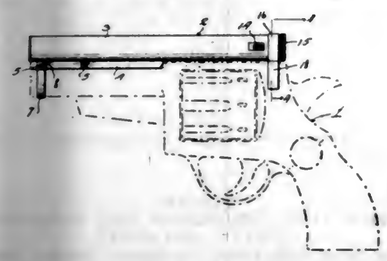


1. A tray attaching device comprising a first member to be attached to a chair arm, a second member to be attached to the under side of a tray, said first member being slidable within said second member and having a series of openings therein and said second member having associated portions cooperating to provide a longitudinal passage in which said first member is received and slidable and having inner and outer parts forming the enclosing sides of a rectangular recess at one side of said passageway, a locking device mounted in said recess and movable transversely thereof and into said passageway to locking position, and means in said recess engaging said device and effective to withdraw said device from locking position by manual operation thereof.

2,108,473
CLIP
Willie W. Breck, Winnfield, La., assignor of one-half to Pearl W. Lasseter, Winnfield, La.
Application August 27, 1937, Serial No. 161,331
4 Claims. (Cl. 24—261)

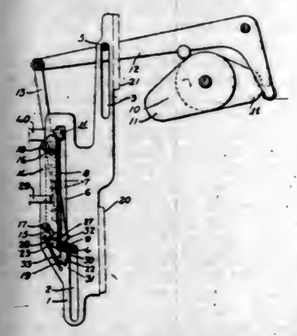
2. A clip including elongated loops pivotally connected and constituting opposed jaws, fingers extending from the respective jaws at their pivots, cross members connecting the fingers, a gravity lock pivotally mounted on one of the cross members for movement into position between the members to hold the jaws against movement relative to each other when pressed together, and means extending from the other cross member for limiting the movement of the gravity lock.

2,108,474
DEVICE FOR THREADING THE NEEDLE IN SEWING MACHINES
Arne Brun and Jacob Andersen Honne, Oslo, Norway, assignors to Isak Andersen Honne, Oslo, Norway
Application June 26, 1935, Serial No. 28,570
In Norway June 6, 1935
12 Claims. (Cl. 112—225)



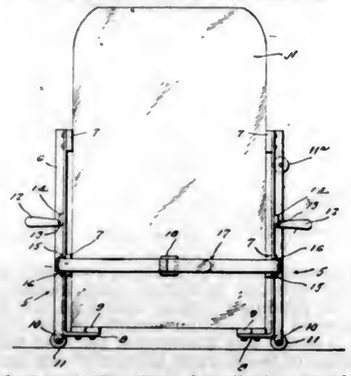
1. In combination with a sewing machine, a needle threading device comprising a threading hook which may be passed through the needle eye, a hook carrying arm pivotally attached to a stationary portion of the machine so arranged as to move in forward direction, passing the hook through the eye and letting the hook catch the thread, and then to move back in the opposite direction, pulling the thread through the eye, a hook guiding member movably mounted on the hook carrying arm, a spring arranged between the arm and guiding member to tend to push the latter forwards on the arm, and guiding means proper provided in such a manner on said guiding member that they during the forward movement of the arm with hook and guiding member forwards towards the needle firstly engage the needle and stop against same to adjust the arm with hook properly relatively to the needle, then during further movement of arm and hook lie stationary and yield relatively thereto to guide the hook safely through the eye, the spring being simultaneously tightened, whereupon during backward movement of the arm finally the spring returns the guiding member on the arm whereby the hook with the caught thread is pulled through the eye during such backward movement of the guiding member into initial position on the hook carrying arm.

2,108,475
COMBINED FIREARM AND SPOTLIGHT
Leonard W. Cooper, La Grande, Oreg., assignor to The Cooper Spot-Sight Co. Inc., La Grande, Oreg., a corporation of Oregon
Application April 21, 1936, Serial No. 75,638
3 Claims. (Cl. 240—6.41)



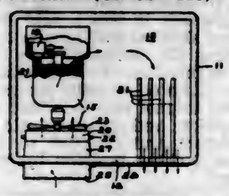
1. In a firearm having a frame body, a barrel extending therefrom and a sight on the muzzle end of the barrel, in which the top of the barrel is lower than the top of the frame body, a target lighting means comprising a tube longitudinally

divided from one end through a portion of its length, a pair of flanges extending longitudinally of the tube and each bordering an edge of the tube division, said flanges extending the length of the division and forming tube supports adapted to rest upon said barrel and having a width sufficient to maintain the tube at an elevation permit-



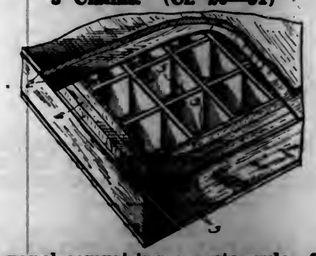
ting the unflanged portion of the tube to extend lengthwise upon the top of the frame body, said sight being disposed between the flanges, means coupling the flanges and drawing the same together into gripping relation with the sight, and light producing means disposed within the tube and arranged to project a light beam from the forward end of the tube.

2,108,476
CALCULATING MACHINE DIFFERENTIAL MECHANISM
Tord Olof Rickard Dahlberg, Stockholm, Sweden
Application May 5, 1936, Serial No. 77,934
In Sweden May 6, 1935
2 Claims. (Cl. 235—8)



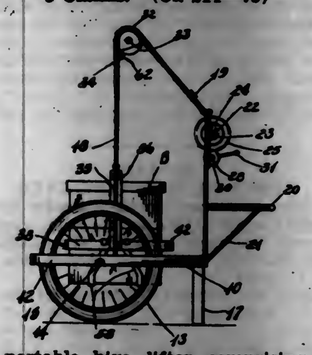
1. In a key controlled calculating machine in combination with a row of key set stops, a movable actuating rack having a row of stops thereon and being provided with a slot parallel to said stop row, a shaft projecting through said slot and being guided therein, a two armed lever pivotally arranged on said shaft and means to reciprocate said shaft and lever positively along said row of key set stops, each of the latter being adapted upon depression of the corresponding key to project into the path of one arm of said lever, the lever being formed and arranged to swing upon the impact of said first lever arm against any of said key set stops into a position in which its second arm engages one of the stops on said rack, whereby the rack is carried along with said lever during a predetermined part of the latter's reciprocation.

2,108,477
REFRIGERATOR HANDLING AND MOVING DEVICE
Frank De Gheselle, East Moline, Ill.
Application March 29, 1937, Serial No. 133,741
1 Claim. (Cl. 280—61)



A device of the class described, comprising a frame including a pair of L-shaped members and cross members connecting said first mentioned members together in spaced relation, an ear on each L-shaped member at the junction of the long arm with the short arm, said ear projecting beyond the short arm, a roller having its pintles journaled in the ears, a platform extending between the short arms and connected at its ends with said arms, and an L-shaped handle pivoted at the junction of its long arm with its short arm to each L-shaped member, the short arm engaging a part of the L-shaped member of the frame to limit upward swinging movement of the long arm of the handle member, the handle member swinging to inoperative position under the action of gravity.

2,108,478
REFRIGERATION APPARATUS
Sidney C. Eaker and Elliott E. Grover, Springfield, Mass., assignors to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 18, 1935, Serial No. 2,342
5 Claims. (Cl. 62—116)



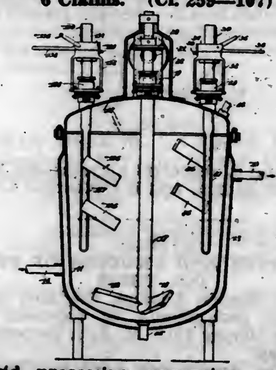
1. In refrigerating apparatus, the combination of a compressor, a motor for driving the compressor, walls forming a machinery compartment for housing the motor and compressor, said machinery compartment having air inlet and exhaust openings in a wall thereof, a fan for circulating air into and out of said machinery compartment through said openings, and a plurality of sound-dampening vanes disposed in spaced relation across one of said openings perpendicularly to said wall embodying said openings, said spaced sound-dampening vanes providing a plurality of substantially unrestricted passages in said last-mentioned opening from said machinery compartment and being effective to dampen the passage of noise from the machinery compartment through the last-mentioned opening.

2,108,479
NONSHRINKABLE WOOD PANEL
Armin Elmendorf, Chicago, Ill.
Application March 11, 1935, Serial No. 10,451
3 Claims. (Cl. 20—91)

1. A panel comprising a rectangular frame of wood, plywood facings extending across opposite sides of and secured to the frame, each facing containing plies in which the grains are respectively at right angles to the axes of the frame, at least some of the grain in each member of the frame running through the same from one of said facings to the other and approximately normal to the facings, and a filler in the space enclosed by the frame and the facings, the filler including pieces of wood distributed across the length and width of the filler whose edge faces are glued to the said facings and contain end grain.

2,108,480
HIVE HANDLING APPARATUS
Wade H. Foster, Bad Axe, Mich.
Application March 4, 1937, Serial No. 128,942
8 Claims. (Cl. 214—75)

1. A portable hive lifter comprising a two wheeled frame, open at its forward end to straddle a bee hive vertically disposed tracks secured to said frame, a hive clamp provided with legs slidably associated with said tracks, and means for raising or lowering said hive clamp.

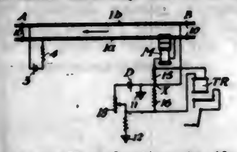


2,108,481
WRITING BOARD
Edward J. Gerety, Bronx, N. Y., assignor to The McBee Company, Athens, Ohio, a corporation of Ohio
Application June 4, 1935, Serial No. 24,796
3 Claims. (Cl. 282—29)

1. A writing board having a platen for supporting a master sheet upon which entries are to be made, a spacer mounted adjacent said platen and adapted for movement along one side of said platen, said spacer being provided with means for locking an entry strip on said master sheet, a movable element, means actuated by the movement of said element for automatically moving said spacer along said platen a predetermined

distance after each entry is made on said master sheet, there being a slot in the lower surface of said movable element into which the entry strip holding means project, elastic and compressible cushions located on the edges of said slot whereby the movement of said element into lowered position operates to clamp said entry strip on the master sheet.

2,108,482
FLUID PROCESSING APPARATUS
Otto W. Greene, Elyria, Ohio, assignor to The Pfaudler Co., Rochester, N. Y., a corporation of New York
Application January 16, 1936, Serial No. 59,424
6 Claims. (Cl. 259—107)



1. Fluid processing apparatus comprising a container for holding fluid, agitating means for moving the fluid within the container, a plurality of dissimilar baffle means within said container, one shaped to deflect fluid upwardly, another shaped to deflect fluid downwardly, and means operable from the exterior of said container for separately adjusting the position of each of said dissimilar baffle means.

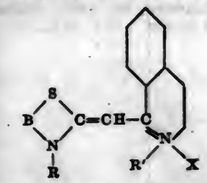
2,108,483
RAILWAY SIGNALING APPARATUS
Lars O. Grondahl, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application May 17, 1935, Serial No. 22,052
4 Claims. (Cl. 246—41)

3. In combination, a section of railway track, a track circuit for said section including a main source of current and a track relay, means including an auxiliary source in the wayside for passing a current in the reverse direction to that supplied from said main source through said track relay, the magnitude of said reverse current being such that normally the track relay energization from said main source predominates sufficiently to maintain said relay picked up, and

means including a ground path for by-passing a portion of the current from said auxiliary source in accordance with variations in the ground resistance whereby when a train enters

said section a small reduction in the energization from said main source renders the reverse energization from said auxiliary source effective to release said track relay.

2,108,484



1'-CYANINE DYES AND A PROCESS FOR THE PREPARATION THEREOF

Frances Mary Hamer and Nellie Ivy Fisher, Harrow, England, assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

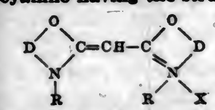
No Drawing. Application January 8, 1934, Serial No. 705,818. In Great Britain January 9, 1933

4 Claims. (Cl. 260—41)

1. A 1'-cyanine dye of the following structure:

wherein R and R' represent alkyl groups, X represents an acid radical and B represents a phenylene group.

2,108,485



OXACYANINES AND PROCESS OF PREPARING THEM

Frances M. Hamer, London, England, assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

No Drawing. Application April 25, 1934, Serial No. 722,255. In Great Britain May 2, 1933

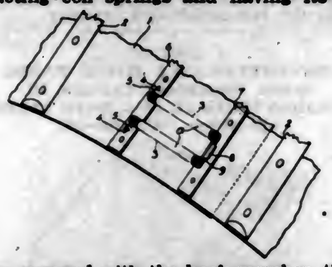
15 Claims. (Cl. 260—44)

4. An oxacyanine having the structure

in which D is a nucleus selected from the group consisting of benzene and naphthalene nuclei, R equals alkyl and X equals halogen.

2,108,486

ENDLESS CONVEYING STRIP FOR HARVESTERS



Sigfrid Valentin Hansson, Langshyttan, Sweden

Application March 9, 1937, Serial No. 129,780

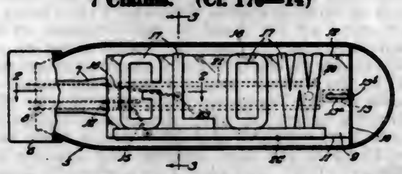
In Sweden March 9, 1936

1 Claim. (Cl. 24—32)

Means for fastening the overlapping ends of endless conveyor strips for harvesters, said means comprising a hook member secured to one of the overlapping ends, two apertured ears secured to the other overlapping end and a U-shaped connecting member having its legs in the form of contracting coil springs and having its bridge

portion engaged with the hook member, the end of each leg being bent outwardly and extending through the aperture of one of the ears.

2,108,487



NEGATIVE GLOW DISPLAY

Andrew F. Henninger, Jr., Chicago, Ill.

Application March 26, 1937, Serial No. 133,198

In Canada April 11, 1936

7 Claims. (Cl. 176—14)

1. In a negative glow device, an envelope, a plurality of electrodes in said envelope, a dielectric sheet of substantial area within said envelope, said sheet having the electrodes mounted thereon whereby the sheet provides the principal support for said electrodes, a press within said envelope, terminals extending from said press, means for electrically joining the electrodes and the terminals, a supporting member of insulating material within said envelope and engaging the inner wall thereof, said supporting member being arranged transversely of the dielectric sheet, the dielectric sheet being supported by said member.

2,108,488

TUBULAR BELT CONVEYER

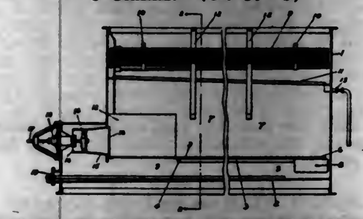
Henry Stinson Johns, North Grimsby Township, Lincoln County, Ontario, Canada, assignor to Bancroft Holdings Limited, Hamilton, Wentworth, Ontario, Canada, a corporation of Ontario, Canada

Application November 24, 1936, Serial No. 112,514

5 Claims. (Cl. 198—165)

1. In a conveying mechanism, a pliable moving material carrying tube having a longitudinally extending slit-like opening through the wall thereof, a plurality of pulleys upon which the tube is suspended and between which it extends, and adjustable means moveable towards the side of the tube opposite said slit to exert a pressure against the tube between pulleys to open it along its slitted side opposite the adjustable means for the reception or discharge of material.

2,108,489



APPARATUS FOR CLEANING METAL PIPES

Ernest Wood Johnson, Frodsham, and Robert Anderson Eastwood, Runcorn, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

Application October 25, 1934, Serial No. 749,996

In Great Britain October 30, 1933

3 Claims. (Cl. 87—5)

1. An apparatus for cleaning metal pipes, both internally and externally, comprising a relatively elongated tank adapted to contain a body of liquid solvent, means for heating said body of liquid solvent, cooling means for preventing the escape of vapor from the top of said tank, a partition extending longitudinally of said tank to provide on one side thereof a pipe cleaning chamber and to provide on the other side thereof a solvent return conduit, a solvent impeller positioned adjacent one end of said tank adapted to draw solvent from said solvent return conduit and to propel solvent in a longitudinally directed stream through said pipe cleaning chamber, and a passageway adjacent to the opposite end of said tank affording passage of solvent from said pipe cleaning chamber to said solvent return conduit.

2,108,490

PRINTING PRESS CLAMP

Seth Q. Kline, Washington, D. C., assignor to General Show Card Machine Company, Inc., Washington, D. C., a corporation of Delaware

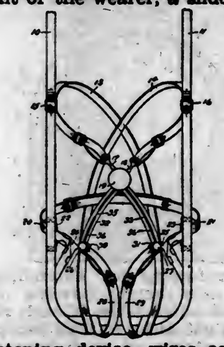
Application September 17, 1936, Serial No. 101,323

5 Claims. (Cl. 101—394)

1. In a hand printing press of the character described, a base, a type plate supported on said base adapted for the reception of a plurality of type and provided with a rear abutment, and a clamping means embodying a bar secured to said type plate by springs in a position to press the type together against said rear abutment.

2,108,491

PARACHUTE SUPPORTING DEVICE



Stig Ove Christian Kuhlemann and Carl Herman Lundholm, Stockholm, Sweden, assignors to Carl H. Lundholm, Aktiebolag, Stockholm, Sweden, a joint-stock company of Sweden

Application September 8, 1936, Serial No. 99,802

In Sweden September 20, 1935

7 Claims. (Cl. 244—151)

1. In a parachute supporting device, the combination of a body attaching strap having its ends for placement at the front of the wearer, a pair of leg straps, a separate device for each of said leg straps each comprising a locking member adapted releasably to connect the leg strap to part of the supporting device, a quick release fastening device releasably connecting together the ends of the body attaching strap which are placed at the front of the wearer, a slide in said quick

release fastening device, wires connecting said slide with the locking members of the leg strap holding devices, and means in said quick release fastening device, whereby upon release of said device first the locking members of the leg straps holding devices are released and then the ends of the body attaching strap are disconnected so as to permit the wearer to free himself from the supporting device.

2,108,492

POCKET MEDICAL OR FIRST AID KIT

Frederick P. Lagier, Ripon, Calif.

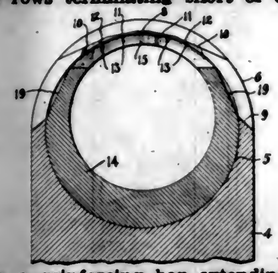
Application September 17, 1936, Serial No. 101,191

1 Claim. (Cl. 206—12)

In combination, a flat pocket case arcuate in cross-section for conforming to the body, the case including a bottom portion and a hinged cover, the bottom portion of the case having an upstanding and transversely extended partition located relatively closer to one end than the other end, and a pair of flat vials fitted freely within the partitioned ends of the bottom portion and dimensioned to permit the cover to close thereover, the vials having depressed portions with circular openings therethrough reinforced by raised marginal rings around the openings, and caps adapted to seat upon the rings for closing the said openings.

2,108,493

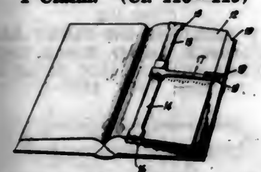
DRY SHAVING DEVICE



Harry Landsiedel, Wilton, Conn., assignor, by mesne assignments, to General Shaver Corporation, Bridgeport, Conn., a corporation of Delaware

Application March 4, 1937, Serial No. 128,936

4 Claims. (Cl. 30—43)

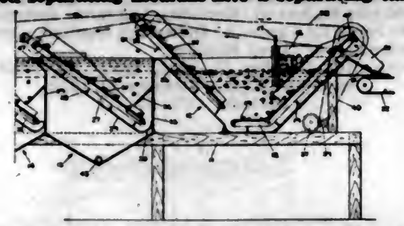


4. A shaver head of the type described comprising an outer member having a passage therethrough forming a wall, the rear surface of which is a portion of a cylinder, the smallest dimension transversely of the axis of said passage being at least twice as great as the radius of said cylindrical portion, an inner reciprocable member mounted in said passage having a por-

tion of its outer surface cylindrical and engaging the cylindrical portion of the outer member, said inner member having a passage therethrough and being transversely slotted to form cutter bars, the outer member being provided with slots which intersect its cylindrical portion and arranged in two rows, the slots of the respective rows terminating short of each other

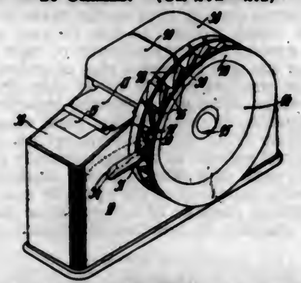
to form a reinforcing bar extending at right angles to the slots thereby forming two rows of cutter bars, the outer faces of each row of cutter bars being cut away on two flat planes, the corresponding planes of each pair converging and forming acute angles with planes at right angles to the radial plane which includes their lines of convergence respectively.

2,106,494
BOOKMARK
Mortimer Nathaniel Lansing, New York, N. Y.
Application June 8, 1935, Serial No. 25,597
1 Claim. (Cl. 116—119)



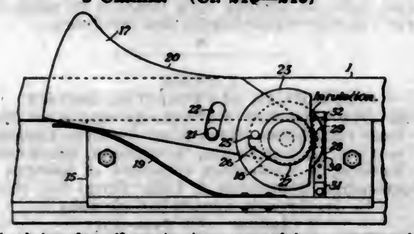
A flat bookmark comprising a body portion having a plurality of telescoping members each of sufficient flatness to lie between the pages of a book when the latter is closed, without materiallyincreasing its thickness or harming itsbinding, said members being frictionally held in any adjusted position relative to each other, the end portions of said body having projections extending at right angles to the body portion lightly to engage the leaves of a book to hold the marker in place, and a flat marker embracing said body portion and movable thereon from substantially one end to the other and frictionally held in any adjusted position, said marker having an extended portion adapted to extend beyond the edges of the leaves of a book and carrying a pocket to receive a card.

2,106,495
METHOD OF AND APPARATUS FOR CLEANING COAL
Nils D. Levin, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio
Application October 11, 1934, Serial No. 747,907
Renewed July 31, 1937
12 Claims. (Cl. 209—173)



7. The method of cleaning coal which comprises mixing a separating medium comprising sand and a relatively small amount of a defloccu-

lating or dispersion agent, storing and aging said medium in a quiescent state, introducing said aged separating medium into a separating tank,



introducing raw coal into said tank, and separately removing the materials which float and those which sink.

2,106,496
GUMMED TAPE DISPENSING MACHINE
Louis Link, New York, N. Y.
Application April 16, 1936, Serial No. 74,628
10 Claims. (Cl. 271—2.4)

1. In a device of the character described, the combination comprising feeding means, operative mechanism for said feeding means comprising a rotatable means, a plurality of manually-engageable, spaced members thereon and substantially fixed means in the path of that part of a hand which is in engagement with one of said members, and in motion with said rotatable means, each of said members in part surrounding said fixed means as said each member passes said fixed means.

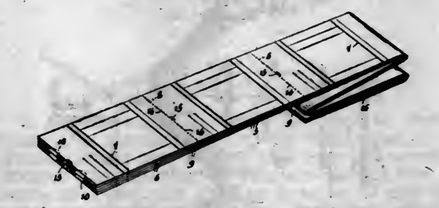
2,106,497
TRACK RAIL CONTACTOR
John W. Livingston, Forest Hills, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Original application October 14, 1933, Serial No. 693,615, now Patent No. 2,077,339, dated April 13, 1937. Divided and this application October 21, 1936, Serial No. 106,842
3 Claims. (Cl. 246—246)

1. A track rail contactor comprising a supporting member attached to the rail, an arm mounted

on said supporting member in such manner that each time a car wheel passes said contactor said arm will be rotated through a limited angle by engagement of the wheel with the arm, the surface of the arm which is engaged by the wheels being so designed that each time the arm is rotated it will be uniformly accelerated at a speed which depends upon the speed of the car, an inertia member operatively connected with said arm in such manner that when said arm is accelerated said inertia member will become accelerated with said arm if and only if the rate of acceleration of said arm is below a predetermined rate, a contact, and means controlled by said inertia member for operating said contact when said inertia member is accelerated at a slower rate than said arm.

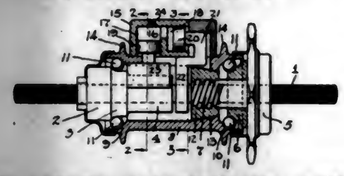
2,106,498
MARINE STEERING GEAR MOTOR
Thomas McLeod, Elizabeth, N. J.
Application April 10, 1936, Serial No. 73,638
2 Claims. (Cl. 60—53)

1. In a marine steering apparatus of the hydraulic type, a stationary piston, a movable cylinder slidable over said piston, a pump, means for conveying oil from said pump to said cylinder on both sides of the piston, said piston having heads closing each end thereof, one of said heads having a chamber, means for conveying oil from said cylinder to said chamber, valves mounted in said head controlling the flow of oil into the chamber, means tending constantly to close said valves, means communicating with the chamber for conveying oil back to the pump, a stub shaft mounted in the chamber, an arm on said shaft adapted to engage and increase the opening of one of the valves and to allow the other valve to close, a lever fixed to said shaft, a bar fixed to one end of the lever, a pair of pulleys mounted on said bar, cables passing over the pulleys, each of said cables having one end thereof fixed to a part movable with the cylinder so that a pull upon one of the cables and a slackening upon the other will effect a movement of the lever to rotate the stub shaft to cause the arm to further open one of the valves and to allow the other valve to close, and arms mounted on the other head of the cylinder and pivotally connected to a rudder arm.



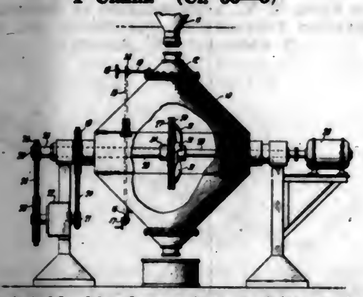
2,106,499
FISHING TOOL
Charles F. Moseley, Bartlesville, Okla.
Original application June 26, 1936, Serial No. 87,579. Divided and this application August 25, 1937, Serial No. 160,923
12 Claims. (Cl. 294—86)

1. In a device of the character described, a well string, a collapsible cone comprising segmental members suspended on said string, slips slidably engaging said cone, means secured to the lower end of the well string for holding said cone in expanded condition, said means being movable downwardly away from the cone to allow the latter to collapse toward the well string, the last-mentioned means including a substantially disc-shaped mandrel engageable with the lower



end portions of the segmental members, and a spear head depending from the mandrel.

2,106,500
CONTINUOUS INTERLEAVED RECORD
John B. Motsinger, Lakewood, Ohio, assignor to American Sales Book Company Inc., Niagara Falls, N. Y., a corporation of Delaware
Application February 4, 1936, Serial No. 62,312
9 Claims. (Cl. 282—12)

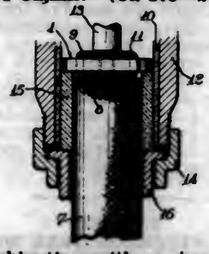


1. In a record assembly, in combination, a plurality of relatively superposed continuous strips including a plurality of continuous record strips and one or more continuous transfer strips interleaved in transfer relation with the record strips, each of said record and transfer strips having a series of weakened transverse division lines arranged in groups depthwise of the assembly and dividing the respective strips into a series of leaves so as to form a series of sets of relatively superposed record leaves with interleaved transfer leaves, at least a part of each of said transfer strip division lines being offset longitudinally of the assembly from the corresponding portions of the record strip division lines so as to form a selective grip extension upon severance along said lines, said transfer strip or strips each having a longitudinal series of apertures positioned respectively adjacent to the groups of division lines and respectively merging with or cutting the said transfer strip division lines, a longitudinal series of strip fastening devices engaging the record strips at points thereof spaced from their respective division lines and respectively passing freely through said transfer strip apertures and offset from said transfer strip division lines, and a longitudinal series of fastening devices securing the strips together at a series of points and positioned directly on the record strip division lines.

2,106,501
COASTER BRAKE
Homer L. Mueller, Cleveland, Ohio, assignor to The Cleveland Welding Company, Cleveland, Ohio, a corporation of Ohio
Application October 23, 1936, Serial No. 107,224
6 Claims. (Cl. 192—6)

1. In a bicycle coaster brake, the combination of relatively rotatable hub and axle members, a fluid-filled chamber fixed with respect to one of said members, pistons extending into said chamber, a brake shoe on one of said pistons and arranged to engage one of said relatively rotatable members, a driving sprocket, and means actuated by said sprocket for actuating the other of said pistons.

2,106,502
BLENDING MACHINE
Frank J. Muench, Newark, N. J.
Application July 17, 1936, Serial No. 91,040
1 Claim. (Cl. 83—8)



A rotatable blender casing, a drive motor, a grinding disk within the casing and connected to the motor to be driven at motor speed, connections between the motor and the casing to drive the casing at reduced speed, a second grinding disk within the casing adjacent the first disk and connected to and moving at the same speed as the casing, one of said disks having flared buckets thereon to catch material and throw it between the disks to be ground.

2,106,503
COLORING MATERIALS
Alexander Murray, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
No Drawing. Application June 19, 1935, Serial No. 27,418
4 Claims. (Cl. 134—47)

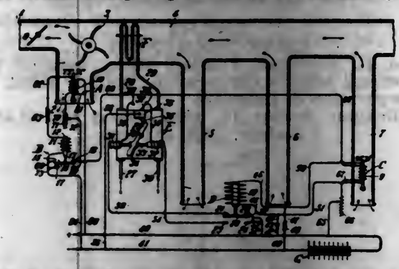
1. A palette for preparing camera copy in a photo-mechanical process comprising a series of coloring materials differing in reflecting power, certain of the materials having incorporated therein a quantity of fluorescent material, the material possessing the lowest reflecting power containing the largest quantity of fluorescent material.

2,106,504
ELECTRICAL CABLE CONNECTER
Edward B. Nowosielski, Sidney, N. Y., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application April 11, 1935, Serial No. 15,835
4 Claims. (Cl. 173—269)

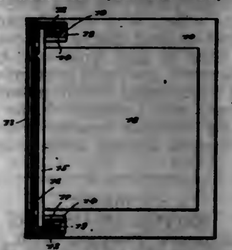
3. In combination with a stranded electrical conductor, an anchoring terminal member therefor in the form of a centrally apertured disc, said conductor being threaded through said aperture, said disc having notches in the periphery thereof so tapered as to be smaller at their inner ends than at their mouths, the strands of said conductor being bent back and into said notches, said notches being closed on said strands to clamp them tightly therein.

2,106,505
METHOD OF PREPARING BITUMINOUS EMULSIONS
John Ogden, Indianapolis, Ind.
No Drawing. Application March 5, 1934, Serial No. 714,094
1 Claim. (Cl. 134—1)

A method of preparing a bituminous emulsion which consists in adding to material of the group consisting of asphalt and petroleum oils substantially one half (½%) percent to substantially two (2%) percent by volume anhydrous acetic acid, adding thereto an aqueous alkaline solution free from alkaline earth compounds, then thoroughly agitating the same to produce an emulsion.



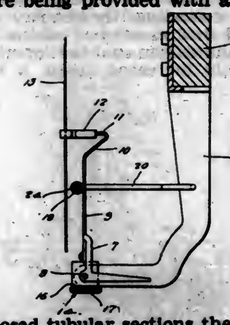
2,106,506
CARPET STRETCHER
Jesse C. Owens, Los Angeles, Calif.
Application June 15, 1936, Serial No. 85,222
8 Claims. (Cl. 254—62)



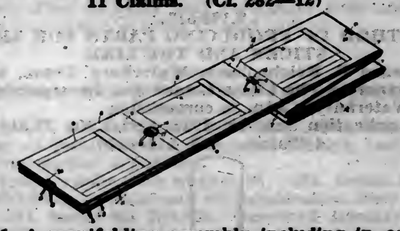
4. In a carpet stretcher, a pair of telescopically connected tubes, a head carried by one of said tubes, carpet engaging prongs projecting from the underface of said head, means including a sleeve, mounted on the larger one of said tubes and connected to the smaller tube for imparting longitudinal movement thereto and a detent carried by said sleeve for engaging and holding the smaller tube against rearward movement.

2,106,507
CORRELATIVE TEMPERATURE CONTROL SYSTEM
Paul B. Parks, Oak Park, and William M. Smith, Chicago, Ill., assignors to Vapor Car Heating Company, Inc., Chicago, Ill., a corporation of New York
Application September 18, 1936, Serial No. 101,462
6 Claims. (Cl. 236—68)

1. In a temperature controlling system, a master thermostat positioned so as to respond to temperature changes at a selected location, an actuating circuit closed by said thermostat at a predetermined temperature, an electric heater positioned to apply additional heat to the thermostat so as to lower the temperature at which the thermostat will close the actuating circuit, an energizing circuit for the heater, a relay in the actuating circuit adapted to make and break the heater energizing circuit as the actuating circuit is opened and closed respectively, means for maintaining a selected temperature in a space, a thermostat responsive to temperature changes in this space for controlling the last-mentioned means, an electric heater for the control thermostat, and an energizing circuit for the last-mentioned electric heater, this energizing circuit being intermittently made and broken by the relay so as to determine the temperature at which the control thermostat will function.



2,106,508
TEMPORARY BINDER
Leo Picard, San Antonio, Tex.
Application August 7, 1936, Serial No. 94,848
6 Claims. (Cl. 129—33)

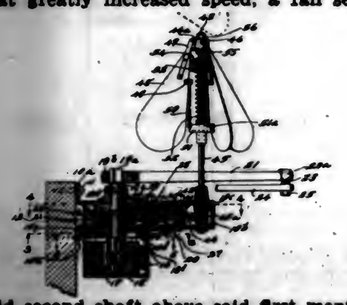


1. In a binder, a cover having spaced posts rigidly connected thereto, said posts having bores therein and slots in the adjacent sides communicating with the bores thereof, a completely removable retaining bar between the posts disposed in said slots and extending into the bores of the posts, and removable plugs received in the bores of the posts for engaging the portions of the retaining bar extending into the bores and adapted to urge the retaining bar uniformly throughout its length to adjustable clamping engagement with said cover.

2,106,509
TEXTILE MACHINE ATTACHMENT
Jacob V. Polcha, Scranton, Pa.
Application November 30, 1935, Serial No. 52,411
Renewed July 14, 1936
4 Claims. (Cl. 28—50)

1. In a textile mechanism, a drop wire assembly including a plurality of drop wires each including a thread engaging hook and a stop mechanism rocker, a backing wire for the drop wire, said backing wire being provided with a plurality of loosely disposed tubular sections thereon against which the drop wires engage.

2,106,510
RECORD ASSEMBLY
William A. Pringle, Niagara Falls, N. Y., assignor, by mesne assignments, to American Sales Book Company, Inc., a corporation of Delaware
Application April 15, 1931, Serial No. 530,199
11 Claims. (Cl. 282—12)



1. A manifolding assembly including in combination, a plurality of relatively superposed continuous strips, each having a series of transverse division lines dividing the respective strips into a series of leaves and forming a series of sets of relatively superposed leaves, respective corresponding division lines of the several strips being arranged in groups in the assembly, said strips having longitudinally spaced selective grip-forming apertures positioned only in the vicinity of alternate division lines in the respective strips, and selective securing means selectively attached directly to and securing together a part only of said securing means attached directly to a part only of said strips and securing them together at each said leaf set and being free of direct attachment to the remainder of the leaves of the said sets, said securing means for the two adjacent ends of adjacent leaf sets including two separate and independent securing devices each of which is adjacent to but spaced a short distance from the respective group of division lines, said independent securing devices being positioned at opposite sides of said division lines.

2,106,511
DOOR CHECK
William H. Pugsley, Minneapolis, Minn.
Application January 4, 1936, Serial No. 57,538
6 Claims. (Cl. 16—49)

1. A door check and closer structure having in combination, a casing adapted to be secured to a door, a shaft journaled in said casing, a second casing below said first mentioned casing into which said shaft extends, a spring in said second

casing and secured thereto and to said shaft, a second shaft journaled in said first mentioned casing and extending thereabove, a train of gears in said first mentioned casing for driving said second shaft from said first mentioned shaft and at greatly increased speed, a fan secured

to said second shaft above said first mentioned casing and affording resistance against the air when said door is swung and said first mentioned shaft rotated, the air resistance to said fan acting as a brake on said spring in the closing movement of said door.

2,108,512

METHOD OF PRODUCING PARTS FOR LIPSTICKS AND THE LIKE

Howard F. Reichenbach, Waterbury, Conn., assignor to The Chase Companies, Incorporated, Waterbury, Conn., a corporation

Application July 19, 1935, Serial No. 32,215
4 Claims. (Cl. 113—116)

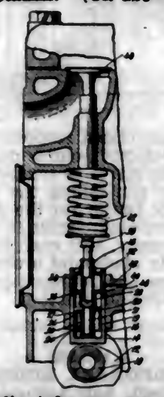
1. A process for producing a cup-shaped carrier member of the class described having an integral hollow boss laterally offsetting from its side wall at a point intermediate its outer and inner ends comprising: shaping a blank to a form which includes a cup-like portion, a flange laterally-offsetting from the outer end of the said cup-like portion and a laterally offsetting hollow boss adjoining both the said flange and the said cup-like portion; and subsequently deflecting the said laterally-extending flange into subsequent parallelism with the axis of the member and beyond the outer edge of the said boss to form a continuation of the said cup-like portion.

2,108,513

CERAMIC INSULATOR AND METHOD OF MAKING THE SAME

Lawrence R. Shardlow, Kearny, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

No Drawing. Application June 10, 1936, Serial No. 84,476
7 Claims. (Cl. 25—156)



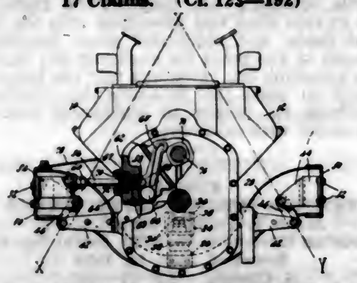
6. The method of making a porous ceramic insulator with a modulus of rupture of about 13,000 pounds per square inch for use at high voltages and high radio frequencies which comprises mixing substantially pure alumina particles measuring about 2 microns in diameter, with 4 to 8% powdered silica, and 2 to 6% powdered acid magnesium meta-silicate, pressing the particles under high pressure into intimate contact, and firing in a hydrogen atmosphere at about 1600° C. for a period of about 140 seconds.

2,108,514

VALVE MECHANISM

Caleb E. Summers, Pontiac, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application August 16, 1935, Serial No. 36,465
9 Claims. (Cl. 123—90)



1. In hydraulic take-up means the combination of telescoping thrust devices, one of said devices being adapted to rest on a body of fluid contained in the other, and valve means associated with said last-named device for controlling the passage of fluid to and from said body and including a member having a portion exposed outside of said telescoping thrust members so as to receive thrust and transmit it to one of said members and yielding means normally urging said valve means toward open position.

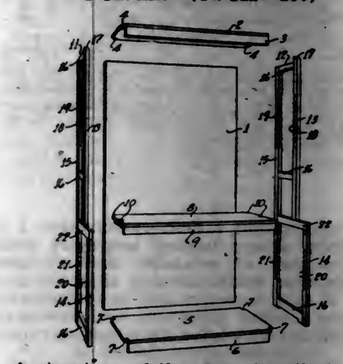
2,108,515

MOTOR MOUNTING

Caleb E. Summers, Pontiac, Mich., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application October 22, 1928, Serial No. 314,203
17 Claims. (Cl. 123—192)

1. An engine or the like of the type that is subject to oscillation about a longitudinal axis under the action of forces inherent in its operation,



a support, means for mounting the engine on the support so as to permit it to have substantially free oscillatory movement about said axis in response to said forces, bracing means for the engine to resist chance vibration, and means operated by the engine for adjusting said bracing means.

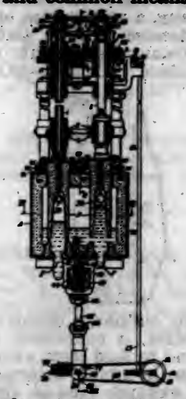
2,108,516

MERCHANDISE DISPLAY UNIT

Thomas C. Thompson, University City, Mo., assignor to Simmons Hardware Company, St. Louis, Mo., a corporation of Missouri

Application December 5, 1936, Serial No. 114,301
4 Claims. (Cl. 312—107)

1. A structure of the class described comprising opposed skeleton side members of unitary form which extend from the bottom to the top of the structure in rigid connected-together arrangement and which are provided with lower portions of greater width than the upper portions thereof, said opposed side members including vertically extended, spaced apart elements, a solid bottom member supported by and extended from one to the other of said opposed side members at the bottoms thereof, a solid top member supported by and extended from one to the other of said opposed side members at the tops thereof, a solid intermediate shelf member supported by and extended from one to the other of said opposed side members at the points where the wider lower portions of said opposed side members meet the narrower upper portions of said opposed side members, said bottom member, top member, and intermediate shelf member being provided with notches at the opposite ends of each thereof which receive said vertically extended spaced apart elements of said opposed side members to produce the assembled structure, portions of said opposed side members being provided with notches adapted for the support of shelves other than the aforesaid intermediate shelf, other shelves supported by said notches of said opposed side members, and vertically extended means forming parts of the assembled structure for supporting said other shelves intermediate of their opposite ends.



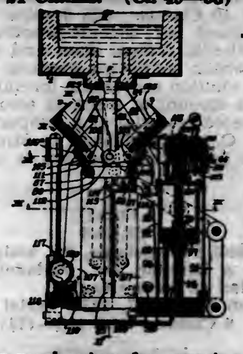
2,108,517

DUAL ORIFICE FEEDER

Frank L. O. Wadsworth, Pittsburgh, Pa., assignor to Ball Brothers Company, Muncie, Ind., a corporation of Indiana

Original application October 24, 1934, Serial No. 749,731. Divided and this application June 24, 1935, Serial No. 28,006
26 Claims. (Cl. 49—55)

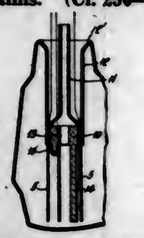
1. An apparatus for delivering individual mold charges of molten glass comprising a forehearth having twin orifices in the bottom thereof, means for periodically segregating a quantity of material over each of said orifices, means for periodically expelling the segregated masses through said orifices, and common means for alternately



severing the glass issuing through said orifices into individual mold charges, including a pair of oppositely rotating shear blades adapted to cross each other at every half revolution first under one and then the other of said orifices.

2,108,518

METHOD AND APPARATUS FOR SEVERING MOLTEN GLASS



Frank L. O. Wadsworth, Pittsburgh, Pa., assignor to Ball Brothers Company, Muncie, Ind., a corporation of Indiana

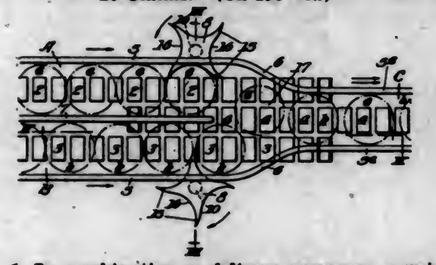
Original application August 28, 1933, Serial No. 687,043. Divided and this application June 16, 1934, Serial No. 730,935. Renewed January 7, 1937
21 Claims. (Cl. 49—55)

1. A shear mechanism for severing individual mold charges from a stream of molten glass comprising, a pair of vertically reciprocable shear blades, means for reciprocating said blades, means projecting into the path of travel of said blades for engaging and moving said blades to a closed position at the beginning of movement thereof in one direction, latch means for locking said blades in closed position during the remainder of the movement thereof in such direction, means adapted to engage and release said latch means at the end of such movement, and means for moving said blade closing means to an inoperative position on movement of said blades in the opposite direction.

2,108,519
STEM ASSEMBLY FOR ELECTRON DISCHARGE DEVICES
Paul Weigt, Berlin-Reinickendorf, Germany, assignor to Allgemeine Elektricitats Gesellschaft, Berlin, Germany, a corporation of Germany
Application September 30, 1936, Serial No. 103,226
In Germany October 10, 1935
3 Claims. (Cl. 250—27.5)

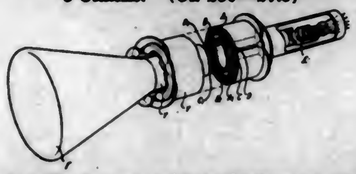
1. An electron discharge device comprising a tubular glass stem, a concentric exhaust tube joined at one end to said stem along an annular sealing junction, a tubing inserted in and attached to said exhaust tube at the junction of the tube and the stem whose material has a coefficient of expansion similar to that of glass, and a melting point substantially higher than that of glass, the exhaust tube being fused to said tubing, and a circular series of spaced lead-in conductors sealed gas tight in said annular junction.

2,108,520
TEXTILE AND METHOD OF FINISHING
Bruno Wolf and Walter Kling, Chemnitz, and Martin Rau, Rabenstein n/Chemnitz, Germany, assignors to Bohme Fettchemie-Gesellschaft, Chemnitz, Germany, a corporation of Germany
No Drawing. Application October 16, 1935, Serial No. 45,270. In Germany October 16, 1934
19 Claims. (Cl. 91—70)



1. A method for wrinkle-proofing artificial and natural silk, cotton, linen and mixtures of the same which comprises treating such material with a solution containing formaldehyde and an effective amount of a strong acid, and heating the treated material at a temperature above about 130° C. but insufficient to injure the material until the desired reaction is complete.

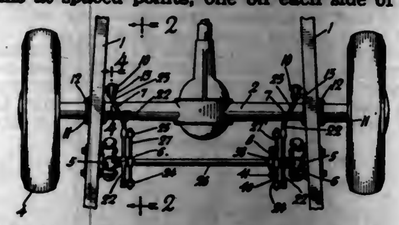
2,108,521
TRUSS
Arthur R. Bell, Philadelphia, Pa., assignor to Wm. H. Horn & Brother, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application March 27, 1935, Serial No. 13,208
8 Claims. (Cl. 128—124)



1. A surgical apparatus consisting of a truss frame adapted for encircling the body and pressing a pad firmly against the body, a pad having a rotatable plate, studs set in said plate and a hasp containing apertures for the passage of said studs, said hasp having a key for engaging an edge of said frame and preventing relative movement of said hasp and frame, said hasp engaging said stud and frame, and at least one of said apertures consisting of an open slot extending to the edge of the hasp and permitting movement of the hasp relative to one of the studs normal to the axis of said stud.

2,108,522
CONTAINER CONVEYER AND DISTRIBUTOR
Christian N. Berymann, Pittsburgh, Pa., assignor of two-sixths to Charles M. Clarke, Sewickley, Pa.
Application November 19, 1936, Serial No. 111,666
10 Claims. (Cl. 198—32)

1. In combination, a delivery conveyer, a pair of relatively slower feeding conveyers leading thereto, a pair of rotatable unit-movement-controlling star wheels located adjacent to the junction of said conveyers and in operative relation to the feeding conveyers, and means connecting the star wheels for simultaneous rotation.



2,108,523
CATHODE RAY TUBE
Michael Bowman-Manifold, Werpleaden Station, England, assignor to Electric & Musical Industries Limited, Middlesex, England, a company of Great Britain
Application November 10, 1936, Serial No. 110,646
In Great Britain November 27, 1935
3 Claims. (Cl. 250—27.5)

1. A cathode ray tube including an electron source for generating a beam of electrons, magnetic deflecting means for deflecting said electron beam along parallel paths mutually displaced in a direction perpendicular to each other, and a surface to be scanned by said beam, said surface having a curvature less than that of a sphere having its center at the effective center of deflection of said magnetic means, said magnetic deflecting means consisting of coils arranged to set up oppositely disposed magnetic poles the center lines of which make an angle of substantially 45° to the direction of the scanning paths on the said surface to be scanned.

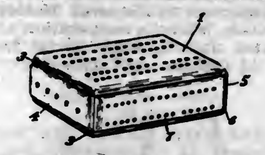
2,108,524
COMBINED SHOCK ABSORBER AND ANTI-ROLL DEVICE
Robert R. Burton, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a Corporation of Delaware
Application September 26, 1934, Serial No. 745,505
2 Claims. (Cl. 267—11)

1. A stabilizer for use in a vehicle chassis having semi-elliptic spring suspension upon an axle, shock absorbers secured to the chassis on opposite sides, operating shafts projecting from the shock absorbers, actuating arms secured to the shafts intermediate their ends, means securing one end of the arms to the axle, pins projecting from the arms at spaced points, one on each side of the

shaft connection, parallel members spaced from the arms and connected thereto through resilient means which contact the pins, a second shorter member rigidly secured to the parallel member on one side only and a rod connecting the end of this last mentioned member to the parallel member on the opposite side.

2,108,525
SPARKING PLUG
Charles Molyneux Carington and Archibald Edward Postlethwaite, London, England, assignors to K. L. G. Sparking Plugs Limited, London, England, a British company
Application July 7, 1937, Serial No. 152,294
In Great Britain December 5, 1936
10 Claims. (Cl. 123—119)

1. A sparking-plug comprising a plug-body composed of two inter-engaging parts, one of which is grooved, and an electrode comprising at least one fine wire located in said groove.

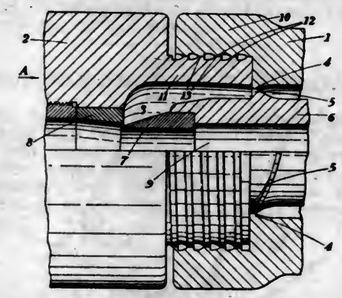


2,108,526
MEMORANDUM HOLDER
Charles C. Clifford, Maplewood, N. J.
Application March 30, 1937, Serial No. 133,791
3 Claims. (Cl. 281—44)

1. A memorandum holder comprising a platform adapted to support a stack of papers and having means for supporting it on a surface, a pair of clamping members provided at opposite ends of the platform and connected together by a cross bar passing under the platform, said clamping members provided with flanges extending in over the platform to secure the papers thereon, and spring means interposed between the bottom of the platform and the top of the cross bar for holding the flanges in yieldable contact with the papers on the platform.

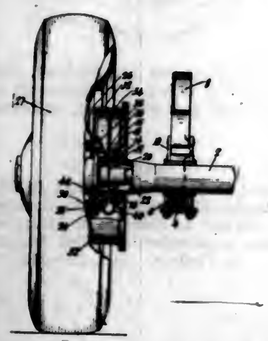
2,108,527
FOLDING CRIBBAGE BOARD
Arthur H. Cudmore, Salem, Mass.
Application August 24, 1936, Serial No. 97,604
12 Claims. (Cl. 272—143)

12. A cribbage board including two scoring surfaces disposable at right angles to each other, each of said surfaces comprising a plurality of sections, means to hold said sections of each surface together, means to hold said surfaces to-



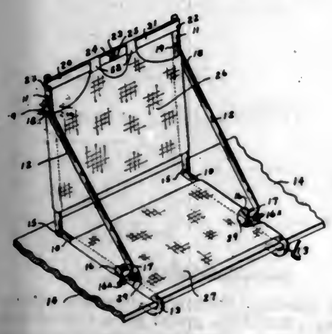
gether when disposed for scoring, said sections of said surfaces being disposable as a box, and means detachably holding said surfaces when so disposed.

2,108,528
PROCESS OF UNITING METALS
Peter Cykajlo, Mansfield, Ohio, assignor of one-half to Henry L. Goemann, Mansfield, Ohio
Application September 26, 1935, Serial No. 42,302
10 Claims. (Cl. 29—189)



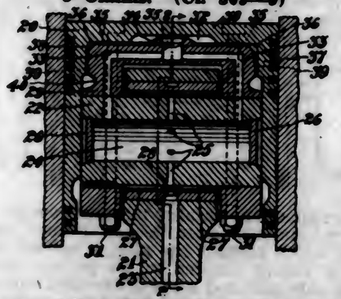
1. A process for uniting metals, comprising: heating a plurality of metals, while juxtaposed, to a temperature approaching the melting points thereof; exteriorly chilling said metals; and rolling said metals before the contacting surfaces thereof have cooled.

2,108,529
METAL EXTRUSION DEVICE
Percy Dunsheath, Kent, England, assignor to W. T. Henley's Telegraph Works Company Limited, London, England, a British company
Application September 10, 1935, Serial No. 39,952
In Great Britain September 29, 1934
10 Claims. (Cl. 207—2)



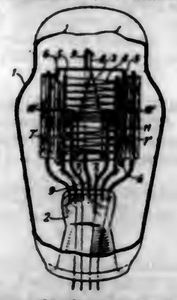
1. A tubular chamber through which under working conditions metal in a highly viscous or plastic state is impelled, comprising two relatively rotatable members together forming a part of the wall of the said chamber, rigid surfaces on the said members making joint with each other in a plane at right angles to the axis of rotation of one of said members, and a metal impelling device formed by providing each of said surfaces with a number of grooves tangential to circles having their centres on the said axis of rotation, the grooves in the one surface intersecting those in the other surface.

2,108,530
RADIO STATIC ELIMINATOR
Ray C. Ellis and Samuel W. Archer, Detroit, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application July 5, 1935, Serial No. 29,954
3 Claims. (Cl. 175—264)



1. In a vehicle, a frame, an axle housing mounted on the frame, a wheel, an axle secured thereto, means for mounting the axle within the housing for rotation comprising lubricated bearings and means forming an electrical by-pass from the axle to the housing and frame around the bearing, said means comprising a flanged ring member and a cooperating spring member having a contact mounted thereon adapted to be maintained in contact with the ring surface, one of said members being secured to the housing and the other to the axle.

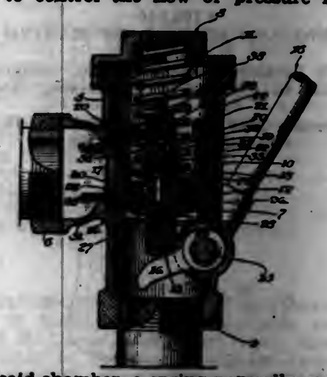
2,108,531
PORTABLE SEAT
William E. Flanders, Detroit, Mich.
Application December 23, 1935, Serial No. 55,692
1 Claim. (Cl. 155—133)



In a legless seat including a back rest and a seat portion pivoted to each other, the combination of side arms pivoted at one end to the side members of said back rest and provided at the other end with hooks adapted to engage means comprising bails pivoted to said seat portion, and a cross member of hinged sections pivoted at either end to said side members, said hinged sections having means to lock them in horizontal alignment.

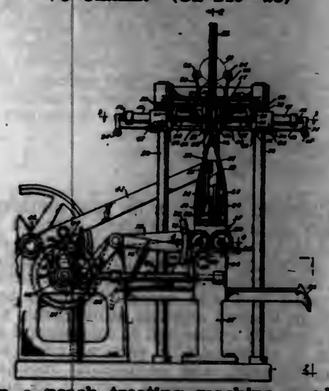
2,108,532
COOLING DEVICE FOR PISTONS
Fritjof Frelin, Phillipsburg, N. J., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey
Application March 5, 1937, Serial No. 129,143
5 Claims. (Cl. 309—9)

1. In a cooling device, the combination of a piston and a connecting rod, a wrist pin connecting the piston and connecting rod, a bearing member between the wrist pin and the connecting rod, a cooling and lubricating fluid chamber in the wrist pin, means defining passages for conveying fluid from the fluid chamber to the bearing member, a second fluid chamber adjacent the head of the piston in open communication with said fluid chamber, and means defining a plurality of passages for conveying fluid from said second chamber to the skirt of the piston.



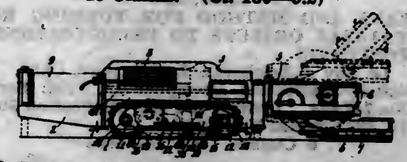
2,108,533
ELECTRODE ASSEMBLY
Thomas J. Henry, East Orange, N. J., assignor, by mesne assignments, to Radio Corporation of America, a corporation of Delaware
Application February 27, 1937, Serial No. 128,091
2 Claims. (Cl. 250—27.5)

1. An electron discharge device comprising a tubular anode surrounding a coaxial grid and filament, a hook for steadying said filament engaging the filament intermediate the ends of the anode, and an annular shield of a width less than the length of said grid surrounding the filament and hook and between the hook and anode.



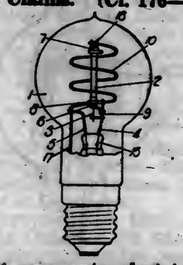
2,108,534
SELF-CLOSING VALVE
Peter Herrmann, East Orange, N. J.
Application March 26, 1937, Serial No. 133,103
7 Claims. (Cl. 251—138)

1. A self-closing valve comprising a casing closed at one end and having a lateral inlet for fluid under pressure and also having an annular valve seat spaced beyond said inlet, a piston valve slidably fitted within said casing to open or close the inlet and also to afford a pressure chamber in the closed end of the casing, said piston valve including a body having a peripheral surface which fully closes the inlet in opposition to the pressure and friction of the excluded fluid before the valve has been seated, and having also a passage extending longitudinally therethrough and non-communicating with the fluid inlet when such inlet is closed by the valve body, a regulating valve in unsealed relation to the said passage to control the flow of pressure into and



from said chamber, a spring normally urging the piston valve across the inlet and toward said valve seat, and actuating means for moving said piston valve to opening position against the action of the spring, the force of said spring being sufficient to move the piston valve to inlet closing position but not to seating position, and the added pressure against the end of the valve remote from the valve seat of the confined fluid within the pressure chamber thereupon overcoming the opposing pressure and friction of the excluded fluid on the surface of the valve, thus effecting the seating of the valve after the closing of the inlet.

2,108,535
PEACH TREATING MACHINE
Percy Jepsen, San Jose, Calif., assignor to Pacific Machinery Company, San Jose, Calif., a corporation of California
Application March 11, 1936, Serial No. 68,160
5 Claims. (Cl. 146—28)



1. In a peach treating machine, a plate for supporting the cut surface of a peach-half, said plate having a pitting aperture, an ejector disc supported within said aperture and spaced therefrom to leave a relatively narrow slot, a pitting knife journaled upon said plate and arranged to operate through said slot for cutting the pit from the peach-half, and means for actuating the disc for ejecting the severed pit from the peach half.

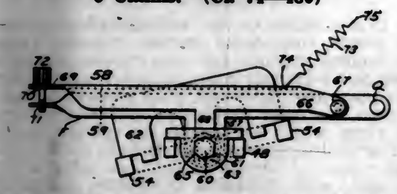
2,108,536
TRACTOR TREAD MECHANISM
Joseph F. Joy, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Original application July 1, 1935, Serial No. 29,310. Divided and this application March 16, 1936, Serial No. 68,975
13 Claims. (Cl. 180—9.2)

2. In a machine of the class described, propelling means comprising endless traction treads and guiding means for said treads including upper and relatively movable lower guide frame parts providing upper and lower elongated guideways for the upper and lower runs of the treads and along which the treads are guided during their orbital movement, said bottom guide frame parts connected together and cooperating to provide said lower elongated guideways, means for individually or simultaneously driving said treads to propel and steer the machine, and means associated with each tread for moving the bottom guide frame parts with respect to the upper guide frame parts to change the shape of said bottom guideways thereby to vary the contact area of the ground engaging surfaces of said treads including fluid operated jacks one individual to each tread, and means for controlling the supply of fluid pressure to said jacks, said frame-parts-moving means being operable to effect a decrease in the ground engaging surface area of the ground engaging portions of the treads to facilitate steering of the machine.

2,108,537
DIRECT ELECTRIC CURRENT RARE GAS LAMP
Anton Lederer, Vienna, Austria; Catherine Danner and General Conrad Randa, executors of said Anton Lederer, deceased, assignors to Ernest Anton Lederer, Glen Ridge, N. J.
Application July 25, 1931, Serial No. 553,172. Renewed July 9, 1937. In Austria February 20, 1931
6 Claims. (Cl. 176—122)

1. A direct current electric cathode-glow lamp, comprising a translucid bulb, a filling in

said bulb consisting mainly of at least one rare gas, a metal cathode in said bulb having a coating of the alkaline earth type, a resistance type heater for said cathode, means for energizing said heater, a wire anode in said bulb consisting of an annulus symmetrically disposed with respect to the cathode and at a uniform distance from the latter, said bulb having a base, lead-in conductors connecting the same to the electrodes and to the heater, said anode having a small total surface area with respect to the cathode area, and being located in that portion of the said bulb near the lead-in conductors and beyond the end of the cathode and means for applying a potential difference between the two electrodes.



2,108,538

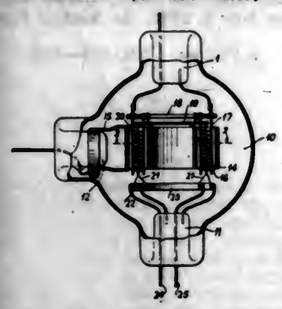
MEANS AND METHOD FOR TURNING ROTATABLE OBJECTS TO PREDETERMINED POSITIONS

Le Roy J. Leishman, Los Angeles, Calif.

Original application December 15, 1934, Serial No. 757,644. Divided and this application June 19, 1937, Serial No. 149,245

6 Claims. (Cl. 74—480)

1. A combination including a plurality of rotatable members having a common axis, a lever manually movable in a plane transverse to said axis, a plurality of adjustable members pivoted to said lever at a point substantially as far from the fulcrum of said lever as said axis is from said fulcrum, each of said adjustable members adapted to engage one of said rotatable members upon movement of said lever, and to move said rotatable member to a predetermined angular position, and means for fixing said adjustable members upon their pivots in predetermined angular positions at will.



2,108,539

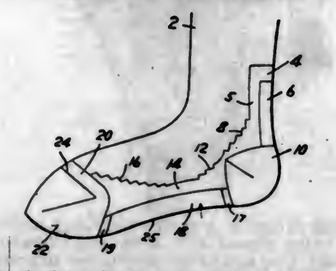
ELECTRON DISCHARGE DEVICE

Nils E. Lindenblad, Port Jefferson, N. Y., assignor, by mesne assignments, to Radio Corporation of America, a corporation of Delaware

Application December 2, 1936, Serial No. 113,751

2 Claims. (Cl. 250—27.5)

1. An electron discharge device having an envelope containing an annular conducting member having a comparatively thick wall and supported from one side of the envelope and having a plurality of longitudinally extending cylindrical chambers spaced around the wall of said annular conducting member, a grid positioned within each chamber and coaxially thereof, a conducting ring electrically connected to and supporting said grids, said ring being supported from another portion of the envelope wall, and a plurality of cathodes positioned and supported centrally of each chamber.



2,108,540

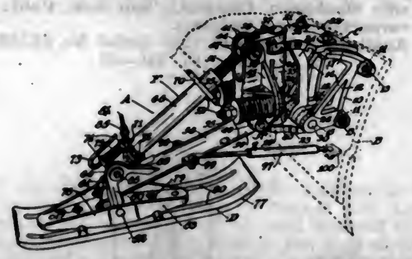
STOCKING AND METHOD OF MAKING THE SAME

Elmer C. Lochhead, Moberly, Mo., assignor of one-half to Charles E. Henderson, Moberly, Mo.

Application May 13, 1936, Serial No. 79,448

11 Claims. (Cl. 66—182)

8. A stocking having a reinforced sole portion and an additionally reinforced part of said reinforced sole portion formed at the bottom thereof by the inclusion of another yarn, said reinforced part being more elastic in the direction of the wales than the adjacent parts of the reinforced sole portion.



2,108,541

LEVELIZER FOR ROAD MAINTAINING APPARATUS

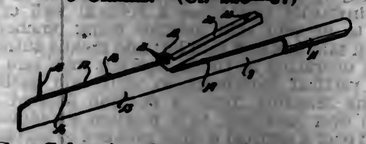
Le Grand H. Lull, Minneapolis, Minn.

Application February 13, 1937, Serial No. 125,570

9 Claims. (Cl. 37—143)

5. A vibration eliminator for road maintenance machinery including a bracket adapted to be attached to a scraper blade or the like, a second bracket pivotally connected to said first bracket along a substantially horizontal axis means connecting said first and second brackets to hold the same in desired angular adjustment, a third bracket pivotally connected to said second bracket along a substantially vertical axis, a road engaging element, and connecting means connecting said road engaging element in adjusted relation to said third bracket.

2,108,542



CUFF FOLDING DEVICE

Joseph Lyska, Detroit, Mich.

Application November 14, 1934, Serial No. 752,928

Renewed October 18, 1937

9 Claims. (Cl. 223—37)

1. A cuff forming device of the class described comprising an elongated flat body; a piercing prong projecting upwardly from one edge of said body adjacent one end; a fabric engaging member for slipping over the edge of a trouser leg; a swingable arm mounted on said body and adapted for lying in alignment therewith when swung to either side of its pivot; and a piercing prong on said arm adjacent one end thereof, said prong being spaced from the point of pivot of said arm a distance substantially equal to the width of the cuff to be formed.

2,108,543

FERRUGINOUS SILICEOUS REFRACTORIES

John M. McKinley, East Cleveland, and Willard K. Carter, Columbus, Ohio; said Carter assignor to National Aluminate Corporation, Chicago, Ill., a corporation of Delaware, and said McKinley assignor to North American Refractories Company, Cleveland, Ohio, a corporation of Delaware

No Drawing. Application July 3, 1935, Serial No. 29,646

10 Claims. (Cl. 106—9)

1. A fired ceramic product comprising siliceous particles and barium ferrite.

2,108,544

CATHODE HEATER FOR ELECTRON DISCHARGE DEVICES

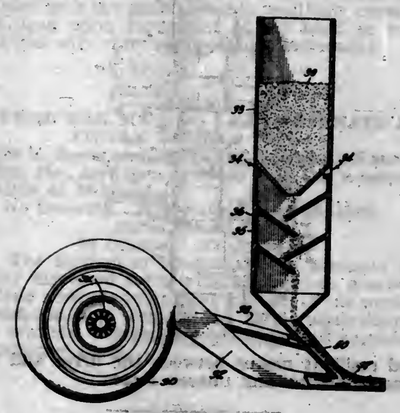
Wilfred Meyer, Birkenwerder near Berlin, Germany, assignor to Allgemeine Elektricitats Gesellschaft, Berlin, Germany, a corporation of Germany

No Drawing. Application December 19, 1935, Serial No. 55,195. In Germany January 4, 1935

3 Claims. (Cl. 250—27.5)

1. An indirectly heated cathode for use with high heating voltages and having a heating resistor in the form of a ceramic body consisting of two components in equal proportions, one component selected from the group vanadium-oxide and niobium-oxide and the other component from the group aluminum-oxide and chromium-oxide.

2,108,545



LOW PRESSURE ABRASIVE BLAST SYSTEM

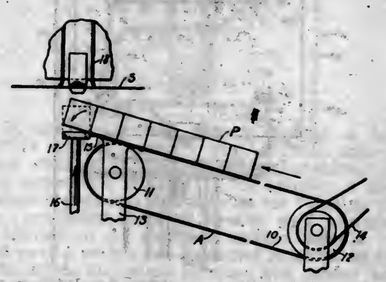
Verne E. Minich, Mishawaka, Ind., assignor to The American Foundry Equipment Company, St. Joseph, Ind., a corporation of Delaware

Application October 20, 1934, Serial No. 749,261

3 Claims. (Cl. 51—8)

1. In an abrasive blast system, a centrifugal air blower having a discharge conduit, a hopper for holding abrasive, an auxiliary mixing chamber under said hopper having air inlets and a series of inclined perforated baffle plates, said auxiliary mixing chamber connecting with said discharge conduit at a point near the discharge end thereof and an auxiliary bypass connecting said pump to the outlet of said auxiliary mixing chamber,

whereby to give the abrasive an initial velocity before being mixed with the main air stream.



2,108,546

MACHINE FOR WRAPPING BARS OF BUTTER OR THE LIKE

Edward F. Ness, Toledo, Ohio, assignor to Morris Packaging Equipment Company, Toledo, Ohio, a corporation of Ohio

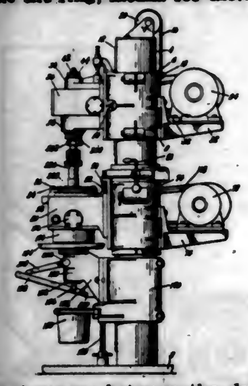
Application December 16, 1935, Serial No. 54,653

3 Claims. (Cl. 93—2)

1. In a butter bar wrapping machine having wrapper folding members, wherein the bars are substantially in contact with each other, means for feeding the bars to the folding members, means for supporting the bars after they leave the feeding means, and means timed to successively move the bars as their rear sides reach the front of the supporting means to the folding members.

2,108,547

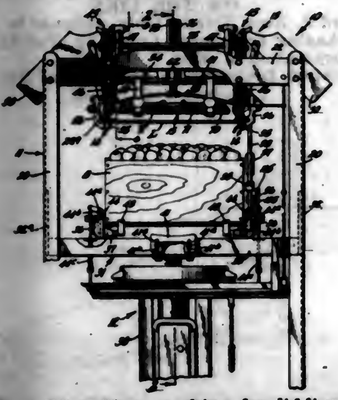
GEAR LAPPING MACHINE



Edward R. Nyland, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

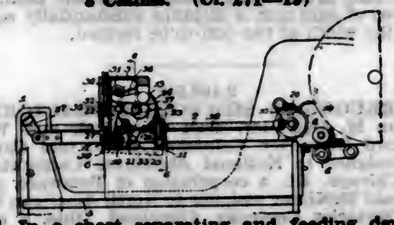
Application February 13, 1935, Serial No. 6,288

19 Claims. (Cl. 51—26)



1. A gear lapping machine comprising, a base, a lapping ring supported on the base, means for reciprocating the ring vertically, means support-

ing a gear having a smaller number of teeth in mesh inside the ring, means for driving the gear



and resilient means between the drive and the gear to absorb any uneven forces.

2,108,548
LIDDING MACHINE
Halo Paxton, Santa Ana, Calif., assignor, by mesne assignments, to Feed Machinery Corporation, a corporation of Delaware
Application April 24, 1935, Serial No. 17,968
22 Claims. (Cl. 1—10)

1. In a lid nailing machine for lidding overfilled packed boxes the combination of: a frame; a nailing table supported on said frame for receiving an overfilled packed box; a pair of nailing units mounted on said frame in spaced relation with each other over said nailing table, each of said units including a cross bar, a plurality of drivers mounted on said cross bar and extending downwardly therefrom, a chuck beam disposed beneath said cross bar, a plurality of nail chucks provided on said chuck beam in alignment with said drivers, means for supporting said cross bar on said frame, and means for supporting said chuck beam so as to be spaced downwardly from said cross bar and so as to be vertically slidable; mechanism on said frame for causing relative vertical movement between said nailing units and said table to bring said chuck beams into contact with opposite ends of a lid placed over said box until the opposite ends of said lid have been pressed against the opposite ends of said box, thereby arching said lid over the contents of said overfilled box, said relative movement then continuing between said table and said cross bars to cause said nail drivers to extend into said chucks to drive nails therefrom through said lid ends and into said box ends; gathering means carried by said chuck beams for gathering produce inwardly from over a vertical wall of said box to prevent said produce being pinched between said box and said lid; and means automatically operating in timed relation with said relative vertical movement to shift said gathering means inwardly, from a position located away from over said box, to a position extending inward over a vertical wall of said box to accomplish the gathering function as aforesaid.

2,108,549
SEPARATING AND FEEDING SHEETS
Walter Pollard, Romford, England, assignor to A. B. Dick Company, Chicago, Ill., a corporation of Illinois
Application October 7, 1936, Serial No. 104,397
In Great Britain October 11, 1935
3 Claims. (Cl. 271—19)

1. In a sheet separating and feeding device for a machine having feed rollers and a rear stop for a pile of sheets, a separating member adjacent said stop, a feed member forward of the separating member, and actuating means for said members whereby the separating member buckles a sheet from the pile forwardly against the feeding member, and said feeding member thereafter feeds said sheet between the said rollers.

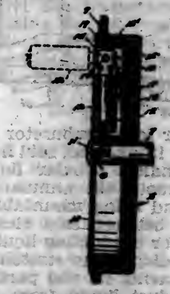
2,108,550
CIRCUIT INTERRUPTER
Herbert L. Rawlins, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application March 30, 1934, Serial No. 718,267
30 Claims. (Cl. 200—117)

28. In a circuit interrupter, means at least partially of insulating material for defining the walls of an arc passage, a plunger arranged for movement through said arc passage, said plunger having a conducting portion normally within said passage and an insulating portion normally without said passage when the plunger is in the closed circuit position, resilient means biasing said plunger to the open circuit position, a fusible element in circuit with said conducting portion for retaining said plunger in the closed circuit position against the bias of said resilient means, said resilient means being adapted to move said conducting portion through said passage in response to the release thereof by said fusible element to establish an arc within said passage and to move said insulating portion into said passage, said insulating portion having a cross sectional area substantially less than that of said passage.

2,108,551
POWDER BOX
Joseph N. Royal, Buffalo, N. Y., assignor, by mesne assignments, to F. N. Burt Company Inc., Buffalo, N. Y., a corporation of Delaware
Application December 4, 1935, Serial No. 52,858
10 Claims. (Cl. 132—82)

1. A powder box of the character described having, in combination, an upper retained powder receiving compartment and a lower loose powder receiving compartment, one compartment being removable from the other, said box having a passageway below said upper compartment through which powder passes from the upper compartment into the lower compartment, the side wall of the upper compartment being less in height than that of the lower compartment and the powder containing capacity of the upper compartment being less than that of the lower compartment, the upper compartment having a frangible and perforable bottom head secured in position over said passageway.

2,108,552
FOUNTAIN PEN
Arthur W. Schoenbergen, Cincinnati, Ohio
Application June 25, 1936, Serial No. 87,247
20 Claims. (Cl. 120—47)



1. In a fountain pen employing a tubular barrel with a writing point and ink feed member disposed at one end of said barrel, and means for exhausting air and admitting and trapping a writing fluid in the interior of the barrel, said means including a piston head mounted for reciprocation relative to the barrel, and means associated with the piston head to positively expand said head upon movement of the head in one direction only of its reciprocatory movement.

2,108,553
METHOD FOR MAKING LEAD ARSENATE IN FINELY DIVIDED FORM
Victor E. Speas and Nathan M. Mesekin, Kansas City, Mo., assignors to Speas Mfg. Co., a corporation of Missouri
No Drawing. Application April 22, 1936, Serial No. 75,750
12 Claims. (Cl. 23—54)

1. The method of producing lead arsenate in highly dispersed form which comprises dissolving lead arsenate in an acid solution of the metaphosphoric acid compounds, and neutralizing said solution, thereby precipitating lead arsenate in dispersed form.

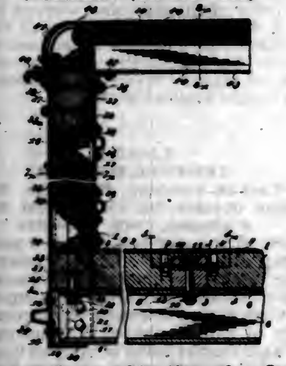
2,108,554
CONTROL HANDLE FOR CAR WINDOWS
William A. Berg, Yakima, Wash.
Application December 30, 1935, Serial No. 56,746
5 Claims. (Cl. 74—547)

1. In combination, a rotary spindle, a wall structure through which said spindle extends formed with an exposed cylindrical chamber lying in concentric relation to the spindle, a disk, operatively engaging the spindle for rotating the latter, revolubly received in the wall chamber and formed in its exposed surface with a recessed cavity which lies in radial relation to the disk to locate the same between the center and the perimeter of the disk, and a crank handle for operating the disk pivotally received in the disk recess with its pivotal axis outermost for movement from an inoperative position within the cavity to an exposed operating position approximately at right angles thereto.

2,108,555
TROUSER HANGER
Carl D. Forsberg, Winnetka, Ill.
Application October 26, 1936, Serial No. 107,634
3 Claims. (Cl. 223—95)

1. A trouser hanger comprising a pair of bows each comprising a pair of shanks integrally connected in upwardly diverging V-shaped formation, one of said shanks being bent upon itself to form a wing facing outward therefrom adjacent the apex of said V-shaped formation, and the other of said shanks being bent upon itself to form an outwardly facing wing adjacent its opposite end, said wings being adapted to extend along

and be seated within the respective creases of a trouser leg, and said bows being fixedly connected

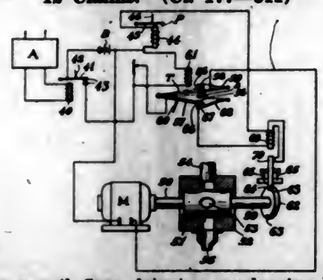


together to lie in registering positions in spaced parallel planes.

2,108,556
AIR HUMIDIFIER FOR A COMBUSTION ENGINE
William G. Hardt, Chicago, Ill.
Application August 31, 1937, Serial No. 161,818
2 Claims. (Cl. 261—100)

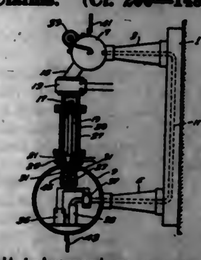
1. A humidifier for a carburetor having an air cleaner on its air intake end, said humidifier consisting of an endless tubular liquid container having a continuous slit annularly around its upper portion and being mountable in the connecting portion between said cleaner and carburetor, means for conducting liquid to said container, a fabric diaphragm stretched across said container and having its end part inserted thru said slit, to conduct liquid from the container, and band means wherewith said fabric is secured in the slit.

2,108,557
BODY FOR CARS
Raymond S. Humbarch, Rochester, N. Y.
Application October 5, 1932, Serial No. 636,346
7 Claims. (Cl. 105—404)



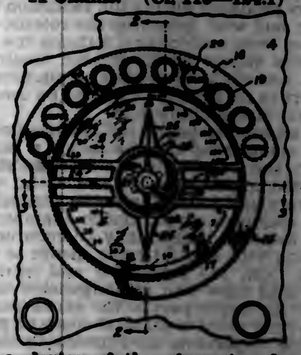
1. In a car the combination of a floor, cross channels under the floor, upright angles fastened to said cross channels, and inside and outside wall plates fastened to said upright angles, the odd numbered angles being fastened to the inside wall member and the even numbered angles being fastened to the outside wall member, each angle being separated from the opposite wall member by an air space means for supporting the inner and outer side wall plates against movement to and from one another the upright angles being longitudinally spaced by the channels, the odd numbered angles being staggered or offset relative to the even numbered angles.

2,108,558
DENTAL INSTRUMENT
William B. Jackman, Niagara Falls, N. Y.
Application May 6, 1936, Serial No. 78,215
Renewed October 12, 1937
2 Claims. (Cl. 128—277)



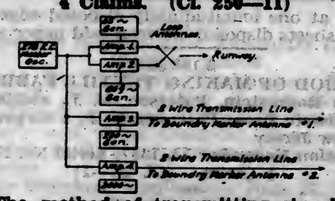
2. A dental tool of the character described, comprising a tubular body, a tubular element extending through said body and free to turn therein and constituting a drainage passage adapted for connection at one end to a source of suction, said body having a sight opening therein through which the fluid drained through the tubular element may be observed, and an applicator nozzle connected by a flexible coupling to the other end of said tubular element and having a shouldered attaching tip including a sealing washer for engagement with the tooth to be treated.

2,108,559
RAIL FLAW DETECTOR MECHANISM
George L. Jones, Garden City, Harcourt C. Drake, Hempstead, and Henry Schumacher, Brooklyn, N. Y., assignors to Sperry Products, Inc., Brooklyn, N. Y., a corporation of New York
Application February 5, 1935, Serial No. 5,046
12 Claims. (Cl. 177—311)



1. In a rail flaw detector mechanism, means responsive to flaw adapted to generate continuous impulses of varying duration depending upon the size and type of flaw, rail marking means, operating means for said marking means comprising a motor, means whereby said impulses set said motor in operation, means whereby continued operation of said motor is capable of actuating said marking means periodically, means for limiting the movement of said motor to a single actuation of said marking means in response to a flaw, and means whereby said marking means is actuated by said motor during a predetermined portion of the movement thereof for a predetermined period in excess of the longest impulse duration.

2,108,560
CIRCUIT BREAKER
Fritz Kesselring, Berlin-Hermsdorf, Germany, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 4, 1934, Serial No. 723,891
In Germany October 30, 1933
3 Claims. (Cl. 200—148)



1. In a circuit interrupter; means for drawing an arc; a volume of arc extinguishing gas; means for causing a quantity of said gas to flow through said arc to effect its extinguishment; and means comprising a closed pressure system for permitting said quantity of gas to be used repeatedly without substantial loss; said closed pressure system including a high pressure tank wherein said gas is normally contained under considerable pressure, a low pressure tank into which said gas flows during each arc extinguishing operation, means for preventing said gas from flowing from said high pressure tank except during each opening operation of said interrupter, and a compressor for returning the gas which flows into the low pressure tank during the operation of the interrupter to the high pressure tank; said compressor being disposed entirely within one of said tanks.

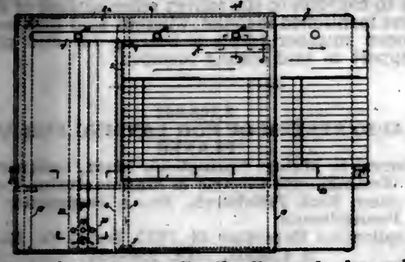
2,108,561
RAPID SELECTOR MECHANISM
William E. Kleruff, Cincinnati, Ohio, assignor to The Crosley Radio Corporation, Cincinnati, Ohio, a corporation of Ohio
Application April 20, 1937, Serial No. 138,002
11 Claims. (Cl. 116—124.1)

1. In a device of the character described, a convex member, a shaft passing substantially centrally through said member, and a dialing mechanism mounted on said shaft and so shaped as to conform to the convex outer surface of said first mentioned member, whereby said first mentioned member forms a bearing for and gives support to said dialing member.

2,108,562
RADIO SYSTEM OF FOG LANDING FOR AIRPLANES
Forrest S. Mabry, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 24, 1935, Serial No. 55,995
4 Claims. (Cl. 250—11)

1. The method of transmitting signals to a common receiver from a plurality of locations utilizing a common source of carrier frequency without producing phase distortion, at any place within range of the transmission, which comprises transmitting energy from one of said locations as modulated carrier energy and the energy from others of said locations as modulated suppressed carrier energy.

2,108,563
METHOD OF EFFECTING SOLUTION OF LEAD ARSENATE
Nathan M. Mneokin and Victor E. Speas, Kansas City, Mo.
No Drawing. Application December 13, 1934, Serial No. 757,416
19 Claims. (Cl. 99—103)



1. The method of effecting solution of lead arsenate and lead arsenate residues which comprises bringing into contact therewith an acid solution containing an anhydride phosphoric acid compound of the class consisting of metaphosphoric and pyrophosphoric acids and their salts.

14. An acid solution of an anhydride phosphoric acid compound of the class consisting of metaphosphoric and pyrophosphoric acids and their salts containing dissolved lead arsenate.

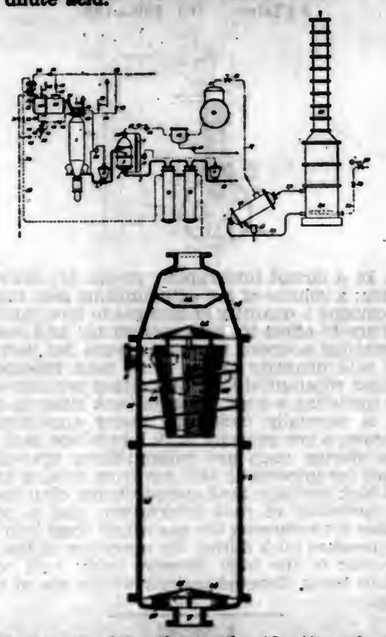
2,108,564
AUTOGRAPHIC REGISTER
William C. Pfeiffer and Frank E. Pfeiffer, Dayton, Ohio, assignors to The Egry Register Company, Dayton, Ohio, a corporation of Ohio
Application October 2, 1934, Serial No. 746,543
14 Claims. (Cl. 282—21)

2. In an autographic register, the combination with a general casing having a top plate with an opening elongated lengthwise of the machine and a slot elongated in the same direction, and having also a table beneath said elongated opening to support superposed paper strips while entering data thereon, of feeding means for the paper comprising a longitudinally disposed endless chain operable in the direction of the printed form on the paper, said chain carrying pins adapted to engage openings located at one side of the paper and to align the paper strips with

one another and means adjacent the side of said table opposite said chain for stationarily supporting at one longitudinally disposed edge only carbon sheets disposed between said paper strips.

2,108,565
METHOD OF MAKING TEXTILE FABRICS
Charles Rosenstein, Paterson, N. J., assignor to Rosenstein Bros., Paterson, N. J., a corporation of New Jersey
Application November 12, 1937, Serial No. 174,226
1 Claim. (Cl. 28—1)

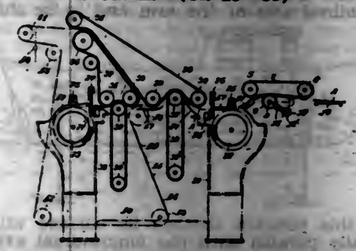
The method of forming woven fabric having a fringe-like surface and a printed design applied to said surface, which comprises weaving warp and weft threads to form a body with a series of spaced parallel float threads on a surface of said body and interlocked with said body at intervals, applying a printed design to the fabric surface and the float threads and the portions of the fabric surface underlying said float threads, and cutting said float threads adjacent one end thereof to form fringe attached to the fabric and lying substantially against the fabric surface.



2,108,566
STAFF-CONTROLLED BABY WALKER
Cary Brooke Sanders, Washington, D. C.
Application April 13, 1937, Serial No. 136,645
9 Claims. (Cl. 227—49)

1. A baby walker comprising harness attachable to the body of the child, and a relatively rigid staff extending from said harness so as to be manually held and moved by an attendant to control the balance of the child.

2,108,567
METHOD OF AND APPARATUS FOR THE SACCHARIFICATION OF SUBSTANCES CONTAINING CELLULOSE
Heinrich Scholler, Munich-Solln, and Rudolf Eichmeyer, Munich, Germany
Application December 14, 1935, Serial No. 54,410
In Germany February 11, 1935
22 Claims. (Cl. 127—37)



7. A method for the saccharification of cellulose which comprises saccharifying cellulose-containing substances under pressure and at an elevated temperature with dilute acid in a percolator, controlling the removal of the sugar wort produced in the reaction by the difference in pressure above and below the filling in the percolator, transferring the sugar wort to an expansion chamber where the pressure is reduced and whereby vapors are produced, separating the vapors from the wort, controlling the quantity of wort in the expansion chamber by regulating the amount of wort removed from said chamber, removing the wort from said chamber when the temperature thereof is not over 100° C., and utilizing the heat remaining in the wort to preheat the water to be used in the production of the dilute acid.

21. A method for the saccharification of cellulose which comprises saccharifying cellulose-containing substances under pressure and at an elevated temperature with dilute acid, withdrawing the sugar wort produced in the reaction, reducing the pressure on the sugar wort, separating the vapors produced during the reduction in pressure from said wort, removing the volatile organic substances from said vapors, utilizing the heat in the purified vapors in the further treatment of the wort, and utilizing the heat remaining in the sugar wort to preheat the water to be used in the production of the dilute acid.

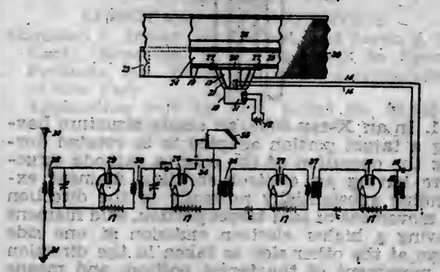
22. In an apparatus for the saccharification of cellulose comprising in combination a percolator in which the cellulose-containing substance is saccharified under pressure and at an elevated temperature and having an outlet through which the wort may pass, an expansion chamber having an inlet disposed tangentially thereon and communicating with a spiral guide, means to conduct the wort from the percolator and introduce it through said inlet into the expansion chamber, means in the upper part of the expansion chamber to permit withdrawal of the vapors produced during the expansion, and means in the lower part of the expansion chamber to permit withdrawal of the expanded wort.

2,108,568
HEMP DRESSING MACHINE
Akira Takata, Toyoka-mura, Kyoto-gun, Fukuoka-ken, Japan
Application July 28, 1936, Serial No. 93,163
1 Claim. (Cl. 19—65)

A hemp dressing machine comprising a material support, an endless feed band mounted near said support, a guide roller mounted on an intermittently oscillatable arm for feeding said material and adapted to be moved into and out of engagement with said endless feed band, two spaced beaters, movable pressing members to co-operate with said beaters, cutting blades and movable dies co-operating therewith for scutching the material passing the beaters, endless intermediate conveying bands arranged one above the other in intermediate spaced relation between said two beaters, endless chains arranged to travel between said intermediary endless bands and in contact therewith and provided with a number of cross bars for carrying material from the machine, and co-operating endless bands arranged to contact said upper and lower intermediate endless bands respectively, one of said last named endless bands being movable in and out of contact with a corresponding intermediary endless band to intermittently feed the material to the chain conveyer.

2,108,569
ELECTRIC HAIR CLIPPER
Nobufumi Tegami, Saga-shi, Japan
Application October 26, 1936, Serial No. 107,672
In Japan June 20, 1936
1 Claim. (Cl. 30—216)

In a clipper, a casing forming a handle for the device, a set of cutters supported at one end of the handle, said casing having a central portion of substantially rectangular cross-section so as to provide a motor housing in the middle portion thereof, an induction motor supported in the housing, said motor comprising an elongated laminated core having an over-all shape in the nature of a rectangular parallelepipedon so as to substantially fit within said casing, field coils encircling the end portions of said core adapted to form a primary field for said motor, a split cross member positioned intermediate of the field coils forming poles for the motor, a short circuited coil associated with each leg of said split cross member, a hollow shaft extending transversely of said casing and a secondary member rotatably mounted on said shaft, a valve supported in one end of said hollow shaft for admitting lubricating fluid and said shaft having radial openings so that the lubricating fluid may reach the outer face of the shaft.



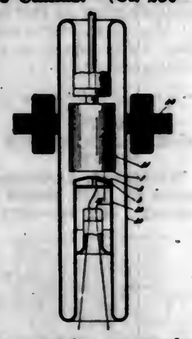
2,108,570
KINDS OF WATER AND METHODS OF PRODUCING THEM
Edward W. Washburn, Washington, D. C.; L. Russell Alden, executor of said Edward W. Washburn, deceased, assignor to American Security and Trust Company, Trustee, Washington, D. C., a corporation of District of Columbia
No Drawing. Application June 27, 1933, Serial No. 677,956
4 Claims. (Cl. 204—9)

3. The method of obtaining isotopic concentration comprising artificially producing a water having an isotopic concentration corresponding to the formula

$$H_2O^{18}$$

partially decomposing said artificially produced water by electrolysis and thereby separately liberating hydrogen and oxygen gases, recombining the liberated gases with each other to produce a new water, and decomposing the water of said recombination by re-electrolysis, and alternately continuing the recombining of the gases and the re-electrolysis of the resultant waters until the density of the final water ceases to decrease with continuation of the process.

2,108,571
PIANO MUSIC-REPRODUCTION ATTACHMENT
Stanhope Wiedeman, Lexington, Ky.
Application March 16, 1937, Serial No. 131,214
6 Claims. (Cl. 84—192)



1. An electrical sound reproducing device comprising, in combination with a piano, a baffle board secured in the casing of the piano behind the sounding board thereof with a separation from said sounding board providing an air column space between the two boards, a loud speaker secured to the baffle board with its diaphragm directed through an opening therein toward said sounding board, and means for connecting the loud speaker with operating means.

2,106,572
WEARPLATE FOR RUBBER OVERSHOES AND THE LIKE
George Henry Wilkinson, Windsor, Ontario, Canada
Application April 22, 1937, Serial No. 138,406
1 Claim. (Cl. 36—7.3)

As a new article of manufacture, a wearplate designed to fit into an overshoe heel receptacle, upstanding diverging flanges on opposite side edges of said wearplate, and rearwardly extending inwardly curved guards on said upstanding flanges for embracing the rear portion of a shoe heel to prevent said shoe heel from puncturing the adjacent wall portion of said receptacle.

2,106,573
X-RAY TUBE
Josef Alfter, Eindhoven, Netherlands, assignor to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands
Application September 24, 1934, Serial No. 745,335
In Germany September 30, 1933
13 Claims. (Cl. 250—35)

1. In an X-ray tube, an anode structure having a target portion adapted to be rotated during the operation of the tube, a cathode structure having an electron-emitting filament extending substantially normally to the direction of movement of said target portion, said filament having a higher electron emission at one side than at the other side as taken in the direction of movement of the target portion, and means to continuously rotate said target portion in the direction in which the temperature of the filament decreases.

2,106,574
BOAT
Corbin S. Atwell, St. Petersburg, Fla.
Application January 18, 1937, Serial No. 121,262
4 Claims. (Cl. 114—126)

1. The combination with a floating body, of an arm pivotally connected with the floating body at a point substantially above the level of the water so that the arm may be swung to generally horizontal and vertical positions, a plate pivotally mounted upon the arm to assume a position with its surface at substantially a right angle to the longitudinal axis of the arm and to be shifted

from this position so that its surface will be generally parallel with the longitudinal axis of the arm, a sleeve slidable upon the arm, a link connecting the sleeve and plate, and a second link pivotally connected with the sleeve and means pivotally connecting the second link with the floating body and being eccentric with respect to the pivot of the arm.

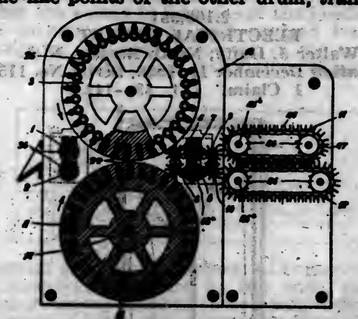
2,106,575
BATHROOM SCALE
Erwin E. Benedict, Rockford, Ill., assignor to The Brearley Company, Rockford, Ill., a corporation of Illinois
Application March 29, 1935, Serial No. 13,729
3 Claims. (Cl. 177—351)

1. A device of the class described, for the weighing of a person in a room, comprising in combination, a domestic type platform scale adapted to rest on the floor of the room in proximity to a wall thereof, a wall type indicator adapted to be attached to the wall at the approximate eye level of a person on said scale, a transmitter including an impedance, means to vary said impedance dependent upon the weight of the person being weighed, electrical connections between said transmitter and said indicator, and means on said indicator and responsive to said variations of said impedance to indicate the weight of the person.

2,106,576
SCAVENGING TWO-STROKE ENGINE
Alfred Bekenäller, Gaggenau, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Application May 2, 1935, Serial No. 19,740
12 Claims. (Cl. 123—65)

3. In a two stroke internal combustion engine,

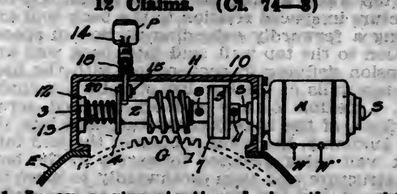
in combination, a cylinder having a series of upwardly inclined tangential ports at the lower end thereof, a piston reciprocating in the cylinder and adapted to uncover the said ports for admitting scavenging and charging air to the cylinder so as to flow in a helical current around the cylinder, said cylinder having a series of downwardly inclined radial ports above said first-mentioned ports and the piston end having a plurality of depressions therein with the bottoms thereof



sloping downwardly from the periphery of the piston and then upwardly towards the centre of the piston adapted to co-operate with said radial ports for guiding upwardly in the axial direction of the cylinder scavenging air admitted though the radial ports prior to the uncovering of the tangential ports by the piston during the downstroke of the latter and subsequent to the covering of the tangential ports by the piston during its upstroke and an exhaust outlet at the upper end of the cylinder.

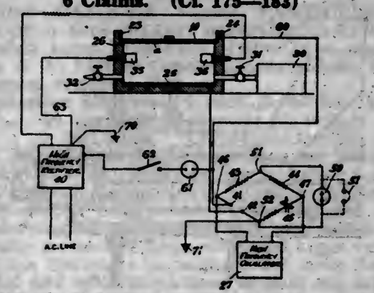
2,106,577
TREATMENT OF MICA FOR ELECTRICAL PURPOSES
Frank William Brough, Chiswick, London, England, assignor to Electric & Musical Industries Limited, Hayes, England, a company of Great Britain
No Drawing. Application April 11, 1935, Serial No. 15,819. In Great Britain June 8, 1934
1 Claim. (Cl. 106—12)

A method of treating mica for use in electron discharge devices prior to its insertion into an electron discharge device which method comprises heating the mica to a temperature between 800° C. and 1000° C. for a period of at least half a minute and at most five minutes, said period being so chosen that a desired increase of thickness results, and thereafter subjecting said mica to pressure, thereby permanently reducing its thickness.



2,106,578
APPARATUS FOR THE TREATMENT OF FIBERS
William Thomas Brown, Wellington, New Zealand, assignor to Fibre Processing Limited, Wellington, New Zealand, Incorporated Company of New Zealand
Application January 24, 1936, Serial No. 60,728
In New Zealand January 31, 1935
8 Claims. (Cl. 19—29)

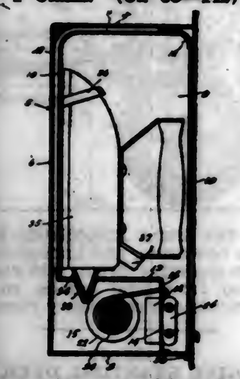
1. An apparatus for treating New Zealand flax and the like fibrous plants, a pair of stripping drums rotatable at high speed, with their opposing peripheries travelling in the same direction, a pair of feed rollers on the entrance and exit side of the drums, the peripheries of said feed rollers travelling at a less speed than that of the stripping drums, the opposing peripheries of the stripping drums set so as to retain the leaf firmly between them, but allow the required slipping, transverse combs on the drums containing a number of needle-like points set close together, the needle-like points of the combs of one drum set to travel immediately behind the needle-like points of the combs of the other drum, the needle-like points of the combs of each drum being in alignment and in alignment with the needle-like points of the other drum, transverse



channels in the drums immediately in front of the combs in one drum, and immediately behind the combs in the other drum, said channels being separated from said combs, so that the needle-like points can completely pierce the leaf.

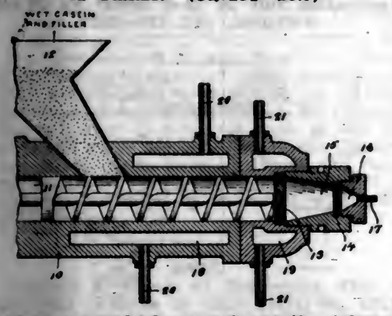
2,106,579
ENGINE STARTING DEVICE
Douglas Collins, Salisbury, N. C.
Application April 16, 1935, Serial No. 16,585
12 Claims. (Cl. 74—8)

1. In an engine starting device, the combination with a gear-ring, a motor, and its shaft, of a worm having a resilient coupling with said shaft, means for moving the worm into engagement with the gear-ring, and means for automatically disengaging the worm from the gear-ring when the engine is started.



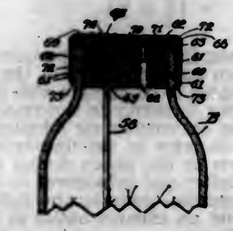
2,106,580
LUBRICANT TESTING DEVICE
Harcourt C. Drake, Hempstead, and Loren J. De Lanty, Brooklyn, N. Y., assignors to Sperry Products, Inc., Brooklyn, N. Y., a corporation of New York
Application July 10, 1935, Serial No. 30,640
6 Claims. (Cl. 175—183)

1. The method of testing a lubricant which consists in applying the lubricant to a plate, vi-



brating said plate at a predetermined frequency, and determining the residue of lubricant remaining on said plate after vibration.

2,106,581
ELECTRICAL OUTLET
Walter J. Duffy, North Bergen, N. J.
Application December 10, 1936, Serial No. 115,231
1 Claim. (Cl. 33—142)



A cabinet structure comprising a box-like structure having an open front and including back and top walls, a false back wall in the box-like structure in spaced relation to the back wall and having a forwardly extending portion in spaced relation to the top wall, said false back wall and extension defining in cooperation with the back and top walls of the box-like structure, a guideway, a flexible closure slidably disposed across the front of the box-like structure and into the said guideway, the lower portion of the said false back wall being disposed forwardly in the box-like structure and then downwardly to meet the bottom of the box-like structure and to define a compartment, a conductor reel in the compartment, and means on the last-mentioned portion of the false back wall adapted to support an electrical connector having its conductor disposed on the said reel.

2,106,582
CASEIN PRODUCT AND PROCESS OF MAKING
Henry V. Dunham, Bainbridge, N. Y.
Application April 26, 1935, Serial No. 18,436
In Great Britain December 8, 1934
12 Claims. (Cl. 134—23.9)

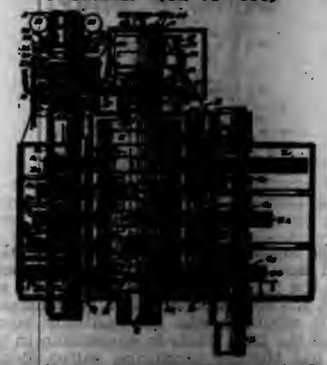
4. A process which comprises intimately mixing and kneading together, under superatmospheric pressure, 75 parts of acid-precipitated casein in the presence of about 10 to 40 parts of water, with about 10 to 150 parts of a filler, continuing the mixing and kneading operation until the materials are completely intermixed and extruding the mass and thereafter mixing the product with an alkali and water, whereby the casein dissolves to afford a liquid casein composition.

2,106,583
CONTAINER
Harry N. Falk, Chicago, Ill., assignor to Baxter Laboratories, Inc., Glenview, Ill., a corporation of Delaware
Application February 26, 1936, Serial No. 65,878
3 Claims. (Cl. 215—95)

1. In combination with a container having an opening and a closure for said opening, said closure having at least one opening extending therethrough, a clamping ring engaging said container and confining said closure in position, a flexible sealing disk extending over said closure and a portion of said clamping ring, and means for confining the peripheral edge portion of said flexible sealing disk against said clamping ring.

2,106,584
TOY VEHICLE
Robert Gluth and Willy Kellermann, Nuremberg, Germany; said Gluth assignor to said Kellermann
Application May 21, 1937, Serial No. 144,083
In Germany November 11, 1935
8 Claims. (Cl. 46—111)

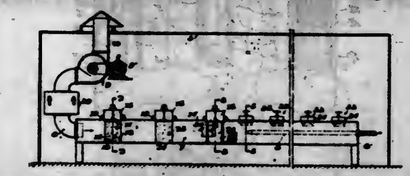
1. A toy-vehicle comprising a casing, a spring-driven clockwork and a sound-producing device to be operated by said clockwork, said sound-producing device consisting of an axle, of mechanism for imparting a combined rotary and periodical swinging motion to said axle from said clockwork, and of a clapper mounted on said axle and adapted to produce a sound when in sliding contact with said casing.



2,106,585
ICE CREAM DIPPER AND MOLD
Andrew M. Healy, Streator, Ill.
Application April 14, 1937, Serial No. 136,895
5 Claims. (Cl. 107—48)

1. In an ice cream dipper and mold, an elongated shank, a scoop at the outer end thereof formed of sections hinged at their inner ends to the outer end of the shank, means slidable on the shank and engaged with the sections of the scoop for opening and closing the scoop sections, and means for anchoring the slidable means to

the shank for holding the scoop sections in closed positions.



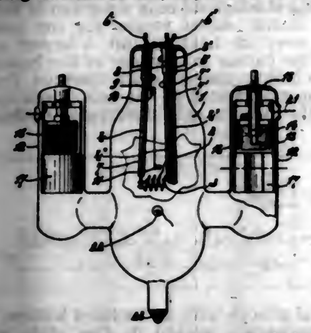
2,106,586
POWER TRANSMISSION MECHANISM
Ree Hutchings, Washington, D. C.
Application March 29, 1937, Serial No. 133,731
3 Claims. (Cl. 74—363)

1. Power transmission mechanism including a driving shaft having gears of different sizes keyed thereto, a driven shaft also having gears of different sizes keyed thereto, and an intermediate rotatable gear assembly including a plurality of pairs of gears, arranged in staggered relation, successive pairs of gears being adapted to transmit power in each of a plurality of positions, one gear of each pair arranged to be driven by a gear on said driving shaft, the other gear of the pair being driven thereby and in turn driving a gear on the driven shaft, and means for rotating said gear assembly through predetermined angles for the purpose of bringing successive pairs of gears of said gear assembly into operation relative with successive gears on said driving and driven shafts.

2,106,587
APPARATUS TO LADEN THE AIR WITH LIQUIDS
Willis Franklin Jones, Anderson, S. C.
Application January 6, 1937, Serial No. 119,226
2 Claims. (Cl. 261—12)

1. In apparatus for treating cotton, a room within which the cotton is placed, an elongated heat radiating casing arranged within the room, a heating unit arranged within the casing and extending throughout only a portion of the length of the casing, outlet means for the casing arranged near the heating unit, a basket arranged within the casing in advance of the heating unit and including spaced cloth covered frames, a distributor arranged at the top of the space between the frames, said distributor having a lon-

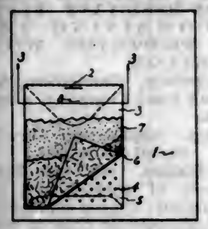
gitudinal groove with an inclined bottom extending downwardly toward its free ends, said distributor having notches spaced longitudinally of the groove and in communication therewith and discharging into the space, a tank arranged above the distributor and having an outlet valve arranged near the center of the longitudinal groove, an air supply pipe connected with the casing, and a rotary blower having its outlet end discharging into the air supply pipe.



2,106,588
PROCESS OF PRODUCING SHEETS FROM CORROSION-RESISTANT FERROUS-BASE ALLOYS COMBINING IMPROVED STRENGH PROPERTIES WITH CORROSION RESISTANCE
Victor H. Lawrence, Norristown, Pa., assignor to Alan Wood Steel Company, a corporation of Pennsylvania
No Drawing. Application May 25, 1935, Serial No. 23,520
6 Claims. (Cl. 148—12)

1. The process of working and heat treating corrosion resistant copper-containing ferrous-base alloys of the ferritic type to produce structural shapes of thin cross-section having improved physical properties, which comprises heating a copper-containing ferrous-base alloy of corrosion resistance analysis and of the ferritic type to a temperature at least approximating the upper critical point, and then hot rolling with accelerated cooling of the metal during the rolling operation, and continuing said combined rolling and accelerated cooling until the temperature of the metal throughout its section has been brought below the lower critical range.

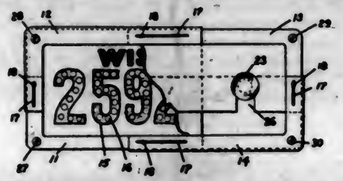
2,106,589
OXIDE CATHODE MORE PARTICULARLY FOR A GAS-FILLED DISCHARGE TUBE
Hendrik Lens, Eindhoven, Netherlands, assignor to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands
Application September 7, 1934, Serial No. 743,139
In Germany September 14, 1933
4 Claims. (Cl. 250—27.5)



1. A discharge tube comprising an envelope, electrodes within said envelope including a cathode structure comprising a plurality of cylindrically-shaped coils concentrically-disposed in a heat-retaining relationship, said coils being electrically interconnected and spaced apart to permit the discharge to readily reach both the internal and external surfaces of each coil, a layer of a highly electron-emitting substance on the surface of said coils, and leads for supplying dis-

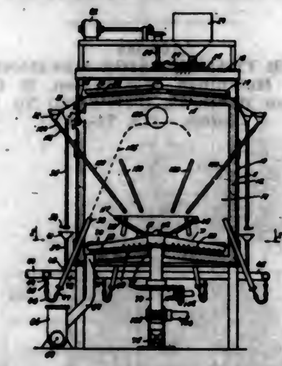
charge current to all of said coils and for supplying heating current to only a portion of said coils,

the remaining portion of said coils being indirectly heated from the directly-heated coils.



2,106,590
PERMANENT WAVING PAD
Carl J. Lowit, Atlanta, Ga., assignor to Industrial Development and Research Laboratories, Incorporated, Atlanta, Ga., a corporation of Georgia
Application November 19, 1935, Serial No. 50,492
9 Claims. (Cl. 132—36.3)

1. A waving pad for enclosing a preformed tress of hair, said pad comprising an outer wrapper, an envelope formed with perforations in one side attached to said outer wrapper, an absorbent pad enclosed in said envelope and adjacent to the perforated side thereof, and chemical means which when moistened will liberate sufficient heat to impart a so called permanent wave to the tress of hair, said chemical means being confined in the envelope aforementioned between the absorbent pad and the unperforated side of said envelope.

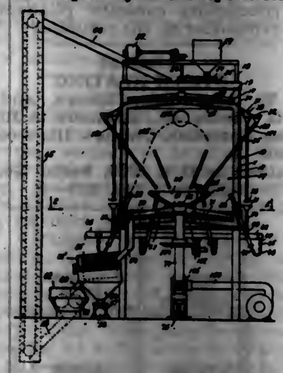


2,106,591
LICENSE PLATE HOLDER
Albert A. Marks, West Allis, Wis.
Application May 22, 1935, Serial No. 22,906
1 Claim. (Cl. 40—133)

In a license plate holder, a hollow casing formed of vertical and longitudinal movable quarter sections slidably engaging one another, and provided with a side opening to receive a license plate having perforated digits, the adjacent wall portions of said sections being overlapped, electric light sockets carried at the inner sides of certain of said sections opposite the said opening, the edges of adjacent walls of the other sections being slotted for engagement about said sockets to allow for a relative adjustment of the sections to vary the area of the said opening to fit above a license plate of a given size, a reflector supported from each of the said sockets for directing light from lamps in the sockets to and through the perforations in said license

plate, and apertures in the side openings to register with aperture in a license plate and to retain the sections in position.

2,106,592
PROCESS FOR ROASTING ORES
Edwin J. Mullen, New Rochelle, N. Y., assignor to General Chemical Company, New York, N. Y., a corporation of New York
Application December 23, 1935, Serial No. 55,808
15 Claims. (Cl. 75—9)

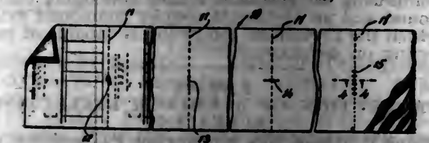


1. The method of roasting coarse metal sulfide ore and metal sulfide fines which comprises introducing the fines into a combustion zone so as to form in the combustion zone a suspension of the fines in oxidizing gas, substantially completely roasting the fines while in suspension in the oxidizing gas thereby producing sulfur dioxide gas and creating high temperatures, forming a bed of the coarse ore, roasting the coarse ore, under influence of the high temperatures developed by the suspension roasting of the fines, under conditions to substantially completely roast the coarse ore and to produce sulfur dioxide, and recovering sulfur dioxide.

2,106,593
PROCESS AND APPARATUS FOR ROASTING ORES
Edwin J. Mullen, New Rochelle, N. Y., assignor to General Chemical Company, New York, N. Y., a corporation of New York
Application December 23, 1935, Serial No. 55,809
13 Claims. (Cl. 75—9)

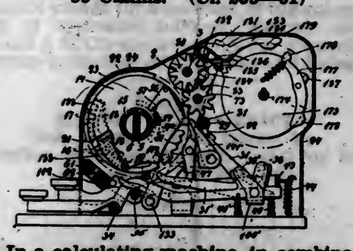
1. The method of roasting coarse metal sulfide ore and metal sulfide fines which comprises introducing the fines into a combustion zone so as to form in the combustion zone a suspension of the fines in oxidizing gas, substantially completely roasting the fines while in suspension in the oxidizing gas thereby producing sulfur dioxide gas and creating high temperatures, forming a bed of the coarse ore, at least partially roasting

the coarse ore under influence of the high temperatures developed by the suspension roasting



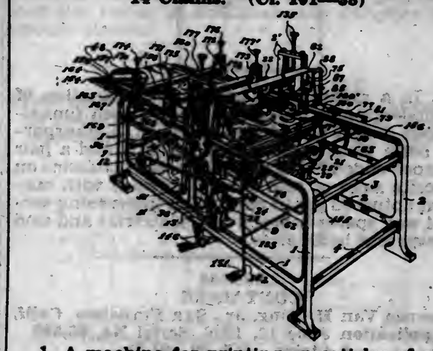
of the fines to produce sulfur dioxide, and recovering sulfur dioxide.

2,106,594
METHOD OF CONSTRUCTING HOLDERS
Charles Nelson, Miami, Fla.
Application August 29, 1935, Serial No. 38,454
Renewed July 16, 1937
2 Claims. (Cl. 113—116)



1. A method of constructing article holders consisting in slitting a sheet of material inwardly from one end to provide a plurality of fingers, slitting the sheet inwardly from the other end to provide legs, bending the intermediate portion of the sheet so that one edge portion will be immediate to the other to provide a body portion, and diverging the said fingers outwardly to article supporting position, pointing and disposing inwardly the free ends of the fingers and bending the legs outwardly to supporting position.

2,106,595
MULTIFORM STATIONERY
Arthur H. Phillips, Hempstead, N. Y., and William Allan, Jr., Ridgefield Park, N. J., assignors, by mesne assignments, to American Sales Book Company, Inc., a corporation of Delaware
Application December 1, 1922, Serial No. 323,046
51 Claims. (Cl. 282—12)

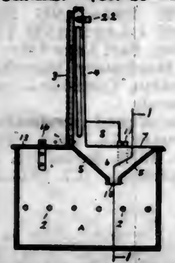


1. Multiform stationery comprising a plurality of superimposed strips having weakened severance lines providing for tearing them into a plurality of multiplicate forms, and stitching located on and extending across said lines for securing the strips together, said stitching engaging and passing through said strips near to but at points spaced from said weakened lines so as to be released from said strips upon tearing along said weakened lines.

2,106,596
CALCULATING MACHINE
Karl Viktor Rudin, Stockholm, Sweden
Application February 27, 1930, Serial No. 431,872
In Sweden July 17, 1929
55 Claims. (Cl. 235—61)

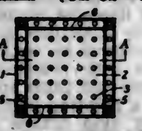
1. In a calculating machine, in combination, a setting disc, a number of adjustable teeth mounted thereon, a cam disc mounted rotatably in coaxial relation to the setting disc, and means cooperating with said cam disc for setting some of the teeth in common upon rotation of the cam disc in one direction from a normal position and for setting the other teeth individually in succession upon rotation of the cam disc in the other direction from the normal position.

2,106,597
MACHINE FOR PRINTING DIRECTLY ON METAL OR GLASS AND THE LIKE
Frederick Shurley, Salt Lake City, Utah, assignor to Ceramic Machinery Distributors Limited, Windsor, Ontario, Canada, a company incorporate of Canada
Refiled for abandoned application Serial No. 711,136, February 14, 1934. This application December 30, 1935, Serial No. 56,833
14 Claims. (Cl. 101—38)



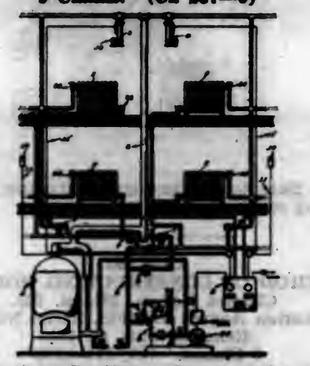
1. A machine for printing on articles of glass, pottery and the like and including in combination a supporting structure, means thereon for receiving and holding an article to be printed, a printing table with printing means thereon, means for moving said table and printing means into and out of a printing position, said printing means engaging said article as said table is moved into printing position, and means for applying ink to coextensive but different portions of said printing means seriatim during its movement in one direction.

2,108,596
FISHING LINE
Lynten Burr, Hampton, Va.
Application September 28, 1936, Serial No. 103,016
17 Claims. (Cl. 43—28)



1. A terminal for a cable comprising a solid metal loop having arms twisted one upon the other, said cable passing through said loop and being twined together with said arms.

2,108,599
GRASSHOPPER TRAP
Halver Olsen Eiane, Washington Island, Wis.
Application April 11, 1934, Serial No. 720,032
6 Claims. (Cl. 43—107)



1. In a grasshopper trap, the combination of an underground pit-box having an open funnel-shaped mouth and throat overhead, a transparent baffle plate adjoining said mouth, and a pair of taper-ended horizontally disposed platforms on opposite sides of said mouth provided with outward upturned guard plates, and intervening vertical wall spaces between said platforms and said transparent baffle plate.

2,108,600
CONTAINER
Clarence Van H. King, Jr., San Francisco, Calif.
Application June 16, 1936, Serial No. 85,522
1 Claim. (Cl. 62—91.5)

A container of the character described comprising an inner and an outer shell with spaces between the top, bottom and sides of the inner shell and the corresponding top, bottom and sides of the outer shell; the bottom to the inner shell being perforated; the top to the inner shell being of heat conducting capacity relatively higher than the remainder of the container.

2,108,601
STEAM HEATING
Richard W. Lentwiler, Chicago, and William Eichholz, Cicero, Ill., assignors to Illinois Engineering Company, Chicago, Ill., a corporation of Illinois
Application April 4, 1936, Serial No. 72,692
9 Claims. (Cl. 237—9)

1. In a steam heating system a source of steam supply, radiation means, supply and return conduits between said source and radiation means, a regulating valve in the supply conduit for controlling the flow of steam to the radiation means, said regulating valve being constructed to be subject in operation to the pressure on the low pressure side of said valve independently of the pressure on the high pressure side of the valve, a spring for acting upon said valve, a motor for tensioning and compressing said spring, a circuit for said motor and a thermostat in the motor circuit responsive to effect of the opening and closing of said valve and arranged to control said circuit to cause the motor to progressively compress or tension said spring according to temperature variations to which the thermostat is subject.

2,108,602
PHOTOGRAPHIC COLOR-FORMING COMPOUNDS
Leopold D. Mannes and Leopold Godowsky, Jr., Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application December 15, 1936, Serial No. 115,972
11 Claims. (Cl. 95—32)

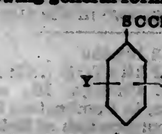
1. A color-forming photographic developer comprising an aromatic amino developing compound and an acetamide coupler compound with which the developing compound is capable of reacting on development.

2,108,603
PRODUCTION OF ALUMINUM REFLECTING SURFACES
Ralph B. Mason, New Kensington, Pa., assignor to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application August 2, 1933, Serial No. 683,944
19 Claims. (Cl. 204—1)

2. A method of producing an aluminum article having a durable light-reflecting surface, comprising anodically treating the aluminum article in an electrolyte containing fluoborate as a major active constituent thereof, and thereafter producing on said surface by anodic oxidation a clear, transparent coating consisting substantially of aluminum oxide.

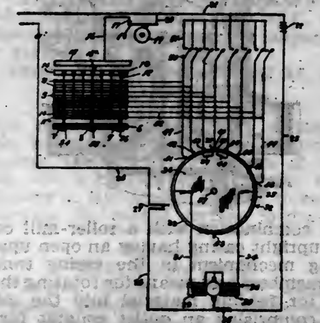
2,108,604
ALUMINUM REFLECTOR
Ralph B. Mason, New Kensington, Pa., assignor to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Original application August 2, 1933, Serial No. 683,944. Divided and this application May 19, 1934, Serial No. 726,571
1 Claim. (Cl. 88—105)

An aluminum light reflector having a bright metal surface from which the impurities normally present in aluminum have been substantially removed, said surface being provided with an adherent, clear, transparent, substantially colorless coating of a thickness of about 0.1 to about 0.4 mil, and consisting substantially of aluminum oxide integrally and artificially formed on said surface, said oxide-coated aluminum surface having a reflection factor of at least 80 per cent and being capable of having its original reflectivity substantially restored by washing.



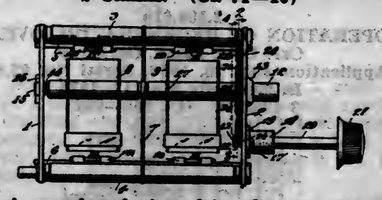
2,108,605
TUBING STOP
Charles F. Moseley, Bartlesville, Okla.
Application June 26, 1936, Serial No. 87,579
16 Claims. (Cl. 166—219)

1. In a device of the character described, a well string, a collapsible cone comprising segmental members supported by said string, slips slidably engaging said cone, and means on the well string for holding said cone in expanded condition, said means being movable axially of the well string away from the cone to allow the latter to collapse toward the well string.



2,108,606
TRIFLUOROMETHYL - PHENYLSULPHIDES, OXIDATION PRODUCTS THEREOF AND PROCESS OF PREPARING THE SAME
Fritz Müller, Otto Scherer, and Willy Schumacher, Frankfort-on-the-Main, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application April 13, 1937, Serial No. 136,668. In Germany April 18, 1936
8 Claims. (Cl. 260—143)

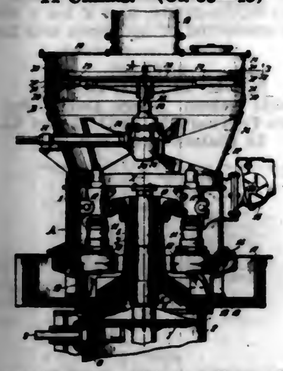
1. The process which comprises causing a fluorinating agent of the group consisting of technically anhydrous hydrogen fluoride and antimony trifluoride to react at a temperature of about 50° C. to about 200° C. with a compound of the following general formula:



wherein X stands for a member of the group consisting of hydrogen, halogen, methyl, nitro, a CF_3- and a $SCCl_3$-group, and Y for a member of the group consisting of hydrogen and halogen.

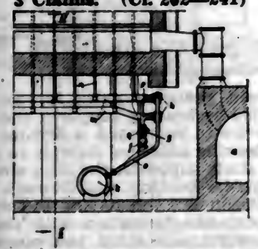
2,108,607
RADIO TUNING DEVICE
Nels Nelson, Upper Darby, Pa.
Application February 27, 1931, Serial No. 518,643
16 Claims. (Cl. 250—20)

9. In a tuning device, a controller connected to the movable tuning shaft of a radio receiving set and including spaced conductors, their contiguous ends forming a recess, electric circuits connected to the conductors, a plurality of contact members in fixed locations relative to the conductors, and means to urge said contact members inwardly whereby each in turn will be projected into the recess to simultaneously complete the electric circuits.



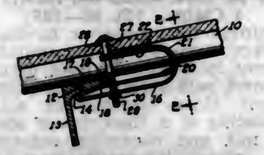
2,108,608
SPEED REDUCING DRIVE
Friedrich C. Neller, Collingswood, N. J., assignor to Radio Condenser Company, Camden, N. J.
Application May 16, 1936, Serial No. 80,071
2 Claims. (Cl. 74—10)

1. A speed reducing drive for an operating shaft carried by bearing supports, the shaft carrying a device to be turned, a driving stub shaft having a bearing attached directly to one of said operating shaft supports, the stub shaft extending through its bearing and through said operating shaft support and having in the extending end a groove-like formation with conical walls tapering toward each other, said operating shaft having a pair of grooves therein and disc-like resilient members fastened, one in each of said



grooves, said disc-like members having an arcuate length of more than 180° but substantially less than 360° and having their free edges extending into frictional contact with the conically shaped walls of the groove in the stub-shaft.

2,108,609
WHIZZER SEPARATOR AND MILL
Richard F. O'Mara, Chicago, Ill., assignor, by mesne assignments, to Combustion Engineering Company, Inc., a corporation of Delaware
Application April 15, 1935, Serial No. 16,443
11 Claims. (Cl. 83—45)



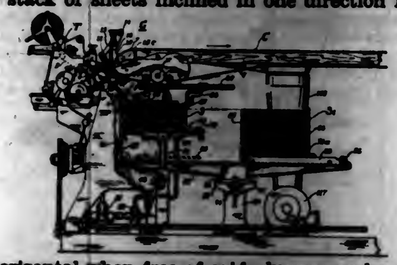
1. In combination with a roller-mill comprising an upright casing having an open upper end, grinding mechanism in the casing comprising rotary members and means for rotating the same, means for feeding material into the mill, and means comprising an outlet conduit for lifting pulverized material from the mill in suspension in an air stream, a separator interposed between the mill and outlet conduit and comprising a laterally closed separator casing forming substantially an upward extension of the mill casing, a rotary deflector mounted for rotation about a central vertical axis within the separator casing, said deflector comprising a closed central portion and a plurality of spaced apart outwardly projecting vanes extending into proximity to the casing walls, an annular stationary deflector carried by the casing wall and closely overlapping the outer end portions of the vanes so that the only path for the upwardly flowing air stream is between the rotating vanes, and means for rotating the rotary deflector.

2,108,610
OPERATION OF REGENERATIVE OVENS
Carl Otto, Essen, Germany
Application July 28, 1936, Serial No. 92,968
In Germany May 17, 1935
3 Claims. (Cl. 202—241)

1. In the operation of a regenerative furnace comprising a connection operable to alternately supply rich fuel gas and degraphitizing air during successive regeneration periods, the method which consists in passing an inert gas through said connection during intervals prior to and following the passage of degraphitizing air through said connection.

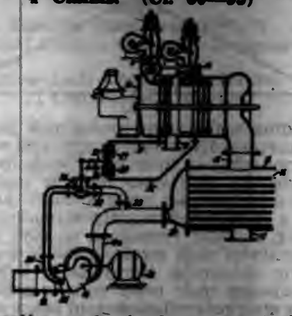
2,108,611
FASTENER FOR ATTACHING CORRUGATED COVERING SHEETS
Harlow T. Richardson, North Plainfield, N. J., assignor to The Ruberoid Co., New York, N. Y., a corporation of New Jersey
Application January 23, 1937, Serial No. 122,027
8 Claims. (Cl. 108—33)

1. A spring clip for securing corrugated covering sheets to underlying supports, the clip being folded to have opposed and spaced legs, one leg for contact with the under face of the covering and the other leg for contact with the under face of the support, the support contacting leg being itself folded into two opposed and spaced reaches, the upper of which serves as the bearing for the clip on the support and the lower of which is yieldable with respect thereto, and a screw or bolt for passage through the covering, upper clip leg and both reaches of the lower clip leg.



2,108,612
CLIP FOR SECURING CORRUGATED ROOF OR SIDING SHEETS
Harlow T. Richardson, North Plainfield, N. J., assignor to The Ruberoid Co., New York, N. Y., a corporation of New Jersey
Application January 23, 1937, Serial No. 122,028
3 Claims. (Cl. 108—33)

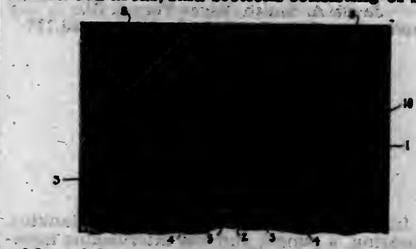
1. A structural assembly, comprising a support for an inclined corrugated covering sheet, an inclined covering sheet resting on the outer end of said support, clips for securing the covering sheet to the support, each clip having a leg parallel to the covering sheet and upon which the covering sheet rests, another leg parallel to the under face of the support for seating the clip on the support, and an inclined reach connecting the two legs, a bolt passing through the covering sheet and the leg in contact therewith to hold the sheet to the clip at one point, and another bolt contiguous to the outer end of the support and passing through the covering sheet and the leg which seats the clip on the support to hold the clip and sheet to the support.



2,108,613
ADHESIVE APPLYING MECHANISM
Ernest G. Rider, Philadelphia, Pa., assignor to Stokes and Smith Company, Summerdale, Philadelphia, Pa., a corporation of Pennsylvania
Application June 22, 1936, Serial No. 86,004
11 Claims. (Cl. 271—62)

1. In apparatus comprising mechanism for removing sheets from a stack thereof, and a plunger for raising the stack adjacent said mechanism, means detachable from said plunger for holding a stack of sheets inclined in one direction from

horizontal when free of said plunger, and a support movable with said plunger inclined in a direction different from said first direction to loosen the sheets.

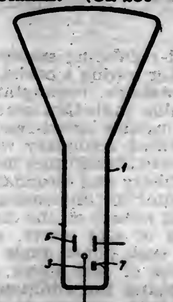


2,108,614
EXTRACTION TURBINE ARRANGEMENT
Arthur Rosch, Brieselang, near Nauen, and Herbert Neumann, Berlin-Wilmersdorf, Germany, assignors to General Electric Company, a corporation of New York
Application December 2, 1936, Serial No. 113,920
In Germany January 23, 1936
4 Claims. (Cl. 60—95)

1. Extraction and mixed pressure turbine arrangement including the combination of an elastic fluid turbine, a condenser for receiving exhaust fluid from the turbine, a conduit connected to an intermediate stage of the turbine, means including a pump for conducting cooling medium to the condenser, and means including a pressure-responsive device connected to the conduit and an adjustable bypass for the pump for automatically controlling the flow of cooling medium in response to changes of the amount of elastic fluid flowing through the conduit.

2,108,615
FLAT KNITTED STOCKING WELT
Erwin Raebel, Richmond Hill, N. Y., assignor to Louis Hirsch Textile Machines, Inc., New York, N. Y., a corporation of New York
Application May 16, 1936, Serial No. 80,028
2 Claims. (Cl. 66—173)

1. A flat knit welt for a full fashioned stocking composed generally of courses of unreinforced short loops composed of yarn corresponding in character and loop length substantially to the leg and a reinforced area for garter attachment, said reinforced area being framed by and separated from laterally adjacent unreinforced areas of fabric by sections having greater elasticity and distortability than either the reinforced or unreinforced areas, said sections consisting of bands



of lace fabric composed of transferred loops extending diagonally across the welt from substantially the top to bottom.

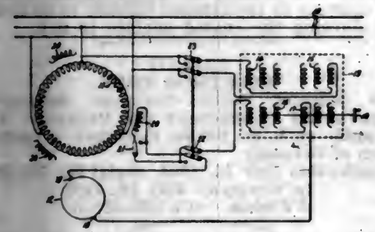
2,108,616
TREATMENT OF MATERIALS
Vincent J. Schaefer, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
No Drawing. Application April 12, 1935, Serial No. 16,036
10 Claims. (Cl. 91—68)

1. The method of making a surface non-wettable by mineral oil which comprises incorporating about 5% by weight of calcium stearate into a moisture-free varnish, applying said mixture to the cleaned surface to be treated and allowing the coated surface to dry.

2,108,617
ELECTRON TUBE
Fritz Schröter, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application July 14, 1934, Serial No. 735,203
In Germany July 28, 1933
5 Claims. (Cl. 250—27.5)

4. An electron device comprising a glass envelope, a thermionic cathode within said envelope for emitting electrons, electron focusing means cooperating with said cathode, and a heat dissociable halogen compound adjacent to said cathode.

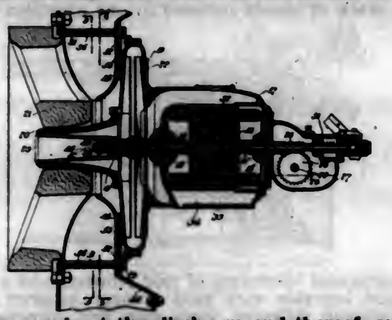
2,108,618
HARD ALLOY
Kaare S. Seljeseter, Bergen, Norway, assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
No Drawing. Application November 10, 1934, Serial No. 752,469
6 Claims. (Cl. 75—136)



1. A hard alloy containing from 99% to 85% of a sintered mixture of tantalum nitride and tantalum carbide and 1% to 15% cobalt.

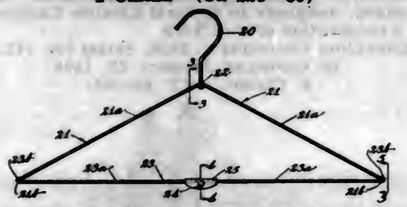
2,108,619
PIERCING DIE
Jacob A. Smith, River Forest, Ill.
Application July 3, 1936, Serial No. 88,777
18 Claims. (Cl. 164—124)

1. In a die set for piercing, forming, blanking, or shearing, a punch, and two interlocking members having overlapping portions having a dovetail telescopic engagement with each other, said overlapping portions engaging and radially supporting said punch.



2,108,620
CONTROL OF ALTERNATING-CURRENT COMMUTATOR MOTORS
Wolfgang Stöber, Berlin-Pankow, Germany, assignor to General Electric Company, a corporation of New York
Application September 1, 1936, Serial No. 98,869
In Germany November 4, 1935
2 Claims. (Cl. 172—274)

1. In a speed-regulating system, an alternating-current motor having a primary winding and a relatively rotatable commutated secondary winding, a double induction regulator for impressing an adjustable speed-regulating voltage on the commutated secondary winding of said motor, an auxiliary transformer means connected between the primary and secondary winding circuits of said motor for impressing an additional speed-regulating voltage on the commutated secondary winding of said motor, said additional voltage having such phase angle as to improve the power factor of said motor, and switching means for reversing the additional speed-regulating voltage with respect to the adjustable speed-regulating voltage and for disconnecting the auxiliary transformer means from the secondary winding circuit of the motor.



2,108,621
MEANS FOR OIL BURNING
John F. Straitz, Philadelphia, Pa., assignor to National Airoil Burner Company, Incorporated, a corporation of Delaware
Application March 3, 1934, Serial No. 713,786
7 Claims. (Cl. 158—77)

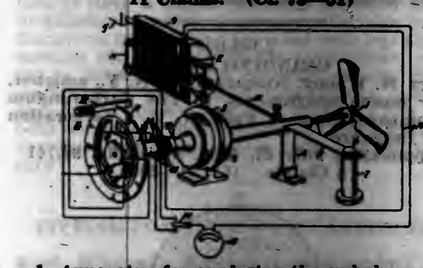
1. In an oil burning system, the combination of a rotating atomizing cup and a nozzle for primary air surrounding the cup, an annular member rotatably seated in the rear wall of the nozzle, air deflecting vanes co-extensive with the nozzle and the cup and interposed between said nozzle and cup, said vanes pivoted in the wall

of the nozzle at the discharge end thereof, and pivoted at their rear ends to said annular member.

2,108,622
COLLAPSIBLE COAT HANGER
Begela Streseff, Minneapolis, Minn.
Application March 10, 1936, Serial No. 68,681
1 Claim. (Cl. 223—89)

A folding coat hanger including a pair of normally downwardly divergent wire coat-supporting arms connected at their upper ends by a pivotal joint whereby said arms may be folded downwardly into compact, substantially parallel relation, a normally upwardly extending support-engaging element connected to said hanger in the vicinity of said pivotal joint, a toggle brace normally extending horizontally between said arms adjacent their lower ends to maintain said arms in divergent relation, said brace comprising two wire sections respectively pivotally connected at their outer ends to the respective arms, a pivot connecting together the inner ends of said respective sections to render said brace upwardly collapsible to permit compacting of said arms in close, substantially parallel relation with said sections, and a saddle clip overlying the pivotally connected inner ends of said wire toggle brace rods and having depending ears which confine the pivotally connected portions of said rod sections, said ears being connected with the respective ends of said pivot and the intermediate portion of said saddle clip having a longitudinal upper portion convex in cross section for abutting said pivotally connected inner ends of said rod sections when said brace is extended to horizontal position to positively restrain said toggle brace from downward collapsing.

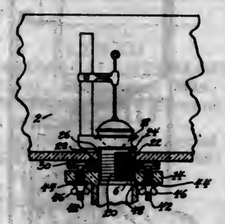
2,108,623
ELECTRIC HEATER
Charles Sykes, Timperley, and William Needham, Sale, England, assignors to General Electric Company, a corporation of New York
Application July 16, 1937, Serial No. 154,107
In Great Britain July 27, 1936
2 Claims. (Cl. 247—1)



1. In a heating device for a cooking stove having heating elements and supply leads, a terminal

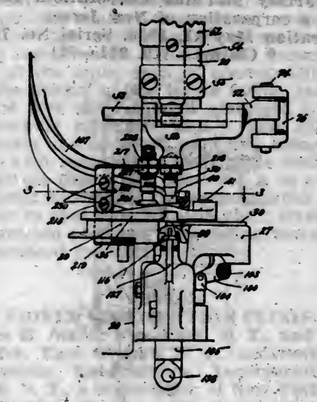
box formed with a joint chamber adapted to house the joints between the heating elements and the supply leads, and having bores extending upwardly from said chamber for accommodating the ends of the heater elements to admit them to the joint chamber, a second chamber intended to be packed with a filling to seal the supply leads, the second chamber being located at one side of

said joint chamber and having an opening or openings in the walls through which the supply leads pass to the joint chamber and a detachable side to said terminal box which side acts as a closure to the joint chamber and to the upwardly extending bores, the jointing surface between said side and the body of said box intersecting the bores longitudinally.



2,108,624
DYNAMICALLY BALANCING ROTATABLE BODY
Ernest L. Thearle, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application April 28, 1936, Serial No. 76,794
11 Claims. (Cl. 73—51)

1. Apparatus for analyzing the unbalance of a rotary body into components respectively associated with a plurality of circumferentially spaced balancing centers, said apparatus comprising means for generating by the action of the total unbalance of the body an electromotive force which is in proportion to the magnitude of the unbalance and the phase of which is dependent upon the location of the unbalance, means to integrate said electromotive force, means for selectively determining the limits of integration such that the effect thereon of forces associated with all but one of the balancing centers will be eliminated, and means for measuring the resultant integrated electromotive force, thereby to determine the separate unbalance effect of the forces associated with the said one of said centers.

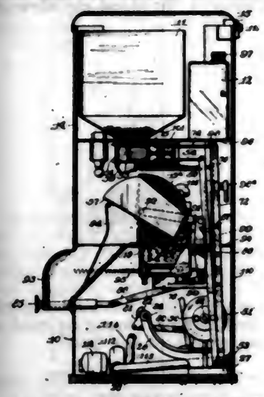


2,108,625
WATER CLOSET COMBINATION
Bert O. Tilden, Trenton, N. J.
Application December 31, 1936, Serial No. 118,456
3 Claims. (Cl. 4—63)

1. In combination with a water closet bowl having a tank supported thereby, means for securing the tank in position on the bowl located entirely outside of the water receiving portions of the combination, a threaded member carried by

the tank to which said means is secured and another threaded member engaging said means for securing said means to the bowl.

2,108,626
WORK FEEDING DEVICE
James R. Townley, Chamois, and Anthony J. Mauntel, Washington, Mo., assignors to Judson L. Thomson Mfg. Co., Inc., Waltham, Mass., a corporation of Massachusetts
Application June 15, 1935, Serial No. 26,756
10 Claims. (Cl. 218—17)

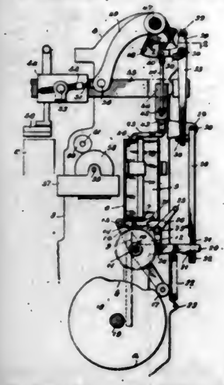


1. A device of the character described comprising a work supporting slide, a yoke bracket, a clamp mounted in said bracket, said bracket being slidably connected at one end to said slide, and means for moving said bracket vertically to apply said clamp to the work on said slide and then horizontally to move said clamp and said slide in unison to feed the work.

2,108,627
AUTOMATIC CORN-POPPING MACHINE
Herbert B. Tyler, Evanston, Ill.
Application September 24, 1934, Serial No. 745,215
22 Claims. (Cl. 53—4)

1. Corn popping mechanism comprising a heat source, a movable popping basket for holding corn to be popped, mechanism for moving said basket into and from popping relation with said heat source, means for interrupting the operation of said mechanism during the popping oper-

ation, and means automatically effecting the reactuation of said mechanism to remove said bas-



ket from said heat source upon completion of the popping operation.

2,108,628

ELEVATING MECHANISM

George W. von Hofe, Bound Brook, N. J., and Bernard D. Dans, Brooklyn, N. Y., assignors to New Jersey Machine Corporation, Hoboken, N. J., a corporation of New Jersey

Application May 11, 1936, Serial No. 79,188
9 Claims. (Cl. 271—62)

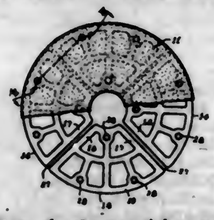
1. The combination of a frame, a vertical hopper supported on said frame, a support for a progressively decreasing stack of sheets or the like vertically movable in said hopper, mechanism including an actuating member and means for operating said member for elevating said support and stack in said hopper, a normally stationary controlling member pivotally suspended on said frame for maintaining the actuating member of said elevating mechanism against operation, a releasing member pivotally suspended on said frame independently of and in operative relation to said controlling member, and means controlled by said stack arranged to pivotally operate said releasing member when said stack has decreased to a predetermined extent to cause said releasing member to develope a pressure upon said controlling member whereby the latter is pivotally actuated to release the actuating member for operation by said operating means to actuate said elevating mechanism and thereby raise said support and stack to periodically restore the upper end thereof to a predetermined level.

2,108,629

PROCESS FOR FRACTIONATING HYDROCARBON OILS

Willem Rhijnvis van Wijk, Amsterdam, Netherlands, assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware

No Drawing. Application August 25, 1936, Serial No. 97,740. In the Netherlands October 3, 1935
11 Claims. (Cl. 196—13)



1. A process for separating hydrocarbon fractions having melting points below that of paraffin wax and contained in a hydrocarbon mixture liquid at —20° C., comprising the steps of chilling said mixture substantially in the absence of a diluent to a temperature below —35° C. to solidify at least a portion of the hydrocarbons having melting points below that of paraffin wax and form an unfiltrable mass of low mobility, adding to the said mass an amount of a liquid solvent in which the lower melting hydrocarbons are more readily dissolved than the higher melting hydrocarbons, said solvent being liquid at the temperature of the filtration, and filtering the resulting mixture to separate the undissolved solid hydrocarbons from the solvent and dissolved lower melting hydrocarbons at a rate of filtration which is greater than that of the same hydrocarbon mixture, when this is mixed with the same amount of said solvent while in the liquid state, chilled to the same temperature and filtered under identical conditions.

2,108,630

GRINDING DEVICE

Avery W. Walker, Niagara Falls, N. Y., assignor, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

Application July 27, 1936, Serial No. 92,741
3 Claims. (Cl. 51—209)

1. A grinding wheel comprising, a homogeneous bonded abrasive disk, a rigid segmental framework embedded in one face of said disk, said framework having bounding ribs in the shape of a sector of a circle and provided with interconnecting ribs formed integrally with said bounding ribs to provide a grid structure within the abrasive whereby the disk is reinforced in the segmental area embraced by said framework.

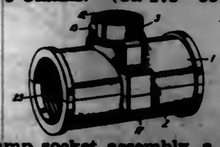
2,108,631

SHOE

Frederick P. Wagner, St. Louis, Mo., assignor of one-half to Arthur J. Brauer, St. Louis, Mo.

Application August 30, 1935, Serial No. 38,495
9 Claims. (Cl. 36—45)

1. A shoe of the oxford type comprising, an exterior upper section having a throat line, lace stays connected to the upper section, said lace stays underlapping the throat line of the upper



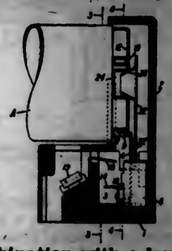
and being free of direct connection to the throat portion of the upper.

2,108,632

DOUBLE ENDED SOCKET

Frederick H. Weston, Bridgeport, Conn., assignor to General Electric Company, a corporation of New York

Application March 6, 1934, Serial No. 714,293
6 Claims. (Cl. 173—337)



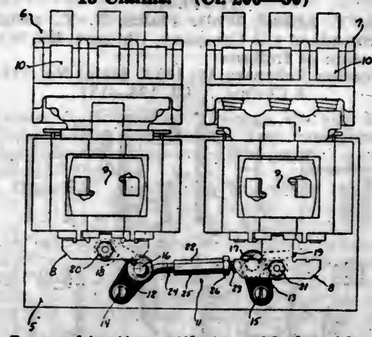
1. In a lamp socket assembly, a socket enclosure of insulating material comprising an upper portion provided with a transverse opening and a lower portion cooperating with the upper portion to form a socket enclosure provided with a longitudinal opening, a nipple positionable in said transverse opening and provided with legs and an opening connecting with the longitudinal opening, a separable lamp receiving means rigidly positionable within said longitudinal opening, and means cooperating with said legs and with both portions of the enclosure for assembling the enclosure and nipple into a rigid, unitary structure.

2,108,633

FITTING FOR TUBULAR INCANDESCENT LAMPS

Kurt Wiegand, Berlin-Hohen-Neuendorf, and Friedrich Göritz, Berlin, Germany, assignors to General Electric Company, a corporation of New York

Application June 3, 1937, Serial No. 146,268
In Germany June 26, 1936
6 Claims. (Cl. 176—29)



6. The combination with a lamp having a ferrule at one end provided with an eccentric groove, of a fitting for the lamp comprising a base, a fixed contact on the base, a movable contact on the base having a part for engagement with said groove whereby by a turning movement of the lamp the movable contact may be moved into and out of engagement with the fixed contact, a removable cap for the base, and means for locking the movable contact out of engagement with the fixed contact when the cap is removed from the base.

2,108,634

MECHANICAL INTERLOCK

Gustav O. Wilms, Milwaukee, Wis., assignor to Allen-Bradley Company, Milwaukee, Wis., a corporation of Wisconsin

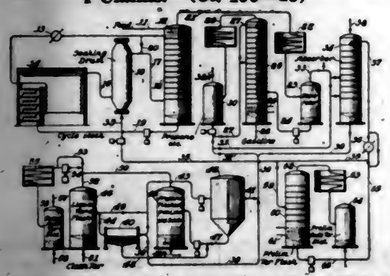
Application March 13, 1936, Serial No. 68,620
15 Claims. (Cl. 200—50)

1. In combination with two side by side movable members, a mechanical interlock for locking said members against concomitant motion in the same direction, said interlock comprising a pair of bell crank levers, fixed pivots mounting the levers at the outer ends of corresponding arms with the apexes of the levers facing each other and the free arms thereof arranged to engage the movable members, and a link connecting the apexes of said levers, said link being of such length with respect to the distance between the fixed pivots that when one lever is in a position permitting movement of its associated movable member in said direction the other lever is held in a position positively preventing movement of its associated movable member.

2,108,635

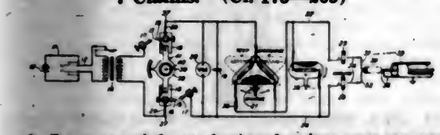
SHIELD FOR IGNITION PLUGS

Charles B. Aiken, New York, N. Y., and Thomas Durfee, East Orange, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York



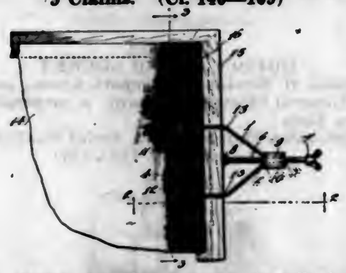
Application May 14, 1929, Serial No. 362,940
2 Claims. (Cl. 123—169)

1. In a shield construction for a spark plug, a ceramic housing over the plug terminal and surrounding the upper portion of said plug insulator



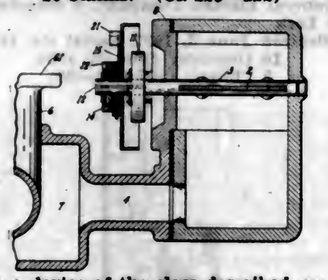
having an aperture in its wall for admitting the high-tension lead wire, means inside the housing for electrically connecting the lead wire to the plug terminal, and a metal shield extending over the outside of the lead wire and the housing and contacting with the base of the plug, said ceramic housing serving to hold the metal shield away from the plug terminal and from the high tension lead wire and its rubber insulation where the latter approaches and enters the said aperture.

2,108,636
PROPANE TREATING IN CRACKING SYSTEMS
Harold V. Atwell, White Plains, N. Y., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application February 16, 1934, Serial No. 711,457
4 Claims. (Cl. 196—13)



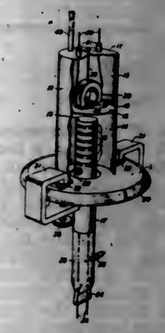
1. In a process wherein hydrocarbon oil is subjected to conversion conditions of temperature and pressure to produce motor fuel, and a relatively viscous pressure tar which is characterized by having asphalt in solution and by having suspended contaminating insoluble solid matter therein which renders said tar difficult to filter the improvement in refining said pressure tar to make it suitable for fuel purposes which comprises cooling said tar, conducting said cooled tar into an absorption chamber, conducting normally gaseous hydrocarbons which are substantially free from gasoline to said chamber, intimately contacting said cooled tar and said normally gaseous hydrocarbons and dissolving not more than about one liquid volume of said normally gaseous hydrocarbons in each ten liquid volumes of said tar, thus decreasing the viscosity of said tar without precipitating any substantial amount of asphalt therefrom, separating undissolved gaseous hydrocarbons from the viscosity-reduced tar, passing the said tar and dissolved normally gaseous hydrocarbons into a separating zone and separating said contaminating insoluble solid matter from the said viscosity-reduced tar, and thereafter removing the dissolved gaseous hydrocarbons from the tar.

2,108,637
TESTING APPARATUS
Charles P. Bartgis, Chatham, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application May 1, 1936, Serial No. 77,328
7 Claims. (Cl. 175—265)



1. In a coaxial conductor having copper projections extending in continuous metallic paths between the inner and outer conductors at spaced points along the length of the coaxial conductor, the method of interrupting the paths which consists in placing a charge of predetermined magnitude on a condenser, discharging the condenser into the coaxial conductor to test for the projections, and discharging the condenser into the coaxial conductor to disintegrate the projections, the charging and discharging being repeated until complete disintegration is effected.

2,108,638
WIRE SCREENING APPLICATOR
Reuben Benedict, East Orange, N. J.
Application March 23, 1937, Serial No. 132,494
5 Claims. (Cl. 140—109)

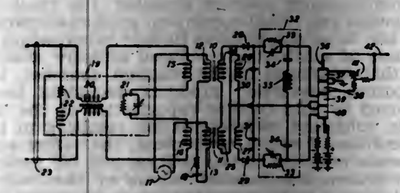


1. A device for the purpose described comprising a frame of two portions laterally spaced a relatively wide distance apart at one end and connected by a cross-bar carrying a plurality of longitudinally arranged brads to engage the meshes of a door or window screen on one side thereof, support means for said frame portions at the end of the frame opposite to that carrying the brads, strain-applying means carried by said support means and having a part adapted to engage the screen frame to which the screening is to be applied.

2,108,639
AUTOMATIC HEAT CONTROL VALVE FOR INTERNAL COMBUSTION ENGINES
George M. Bicknell, St. Louis, Mo., assignor to Carter Carburetor Corporation, St. Louis, Mo., a corporation of Delaware
Application July 30, 1932, Serial No. 626,858
10 Claims. (Cl. 123—122)

1. In a device of the class described, an intake manifold, an exhaust manifold, a branch passage for conveying exhaust gases from said exhaust manifold to heat said intake manifold, a rotatable valve mounted in said exhaust manifold for directing exhaust gas into said passage, said valve being eccentrically mounted on a shaft, and yielding means constantly urging said valve toward the position to direct gas into said passage.

2,108,640
ELECTRON DISCHARGE APPARATUS
Carl A. Bieling, Westfield, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application November 7, 1936, Serial No. 109,650
11 Claims. (Cl. 250—27.5)



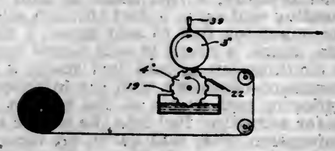
1. An electron discharge device comprising means forming a chamber, including a metallic diaphragm constituting the anode of the device, a cathode in cooperative relation with said anode, flexible means mounting said cathode in said chamber, means for flexing said mounting means to vary the spacing between said cathode and said anode, and means for vibrating said diaphragm.

2,108,641
SURFACE TREATMENT OF MATERIALS
Katharine B. Blodgett, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
No Drawing. Application April 12, 1935, Serial No. 16,033
2 Claims. (Cl. 91—68)

1. In combination, a metallic article having a surface area provided with a continuous film of even thickness consisting of ferric stearate, said film being non-wettable by oil.

2,108,642
MAGNETIC DEVICE
Edward M. Beardman, Mountain Lakes, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application August 20, 1936, Serial No. 96,927
9 Claims. (Cl. 178—70)

8. An amplifying system comprising in combination a single magnetic modulating system, power supply windings interlinking said modulating system for normally energizing all the elements of said modulating system to substantially the same magnitude during each half cycle of the alternating power supply, an input circuit interlinking said system, two output circuits interlinking said system, a unilateral conducting device connected to each of said output circuits to pass opposite half cycles of current induced in said output circuit and a load circuit oppositely connected to said unilateral conducting devices whereby an amplified positive current flows in said load circuit in response to a positive current flowing in said input circuit and an amplified negative current flows in said output circuit in response to a negative current flowing in said input circuit.



2,108,643
GREASE
Lawrence C. Brunstrum, Chicago, Ill., and Elmer Wade Adams, Hammond, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
No Drawing. Application December 31, 1935, Serial No. 57,062
10 Claims. (Cl. 87—9)

1. A calcium soap grease stabilized against the separation of soap or oil and containing not to exceed about 3% of water comprising as a stabilizing agent from about 1% to about 8% of an oil-soluble monohydric alcohol boiling above 200° F.

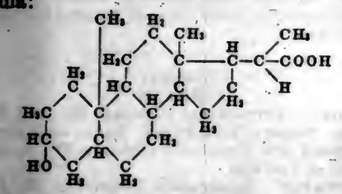
2,108,644
GREASE
Lawrence C. Brunstrum, Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
No Drawing. Application March 22, 1934, Serial No. 716,911
12 Claims. (Cl. 87—9)

1. A calcium soap grease stable at temperatures in excess of about 300° F. and containing less than about 3% of water, comprising as a stabilizing agent from about 2% to about 8% of a partial ester of a polyhydroxy alcohol and a fatty acid.

2,108,645
MANUFACTURE OF FLEXIBLE ABRASIVE ARTICLES
Robert C. Bryant, Niagara Falls, N. Y., assignor, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware
Application March 18, 1933, Serial No. 661,629
8 Claims. (Cl. 91—68)

1. The method of manufacturing intermittently coated abrasive fabric which comprises giving one surface of the fabric a substantially uniform coating of adhesive, then squeezing the adhesive from portions of said surface which it is desired to have free from abrasive, then projecting abrasive grain onto the surface thus intermittently coated with adhesive, and thereafter hardening the adhesive.

2,106,646



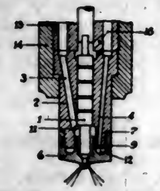
STERINE DERIVATIVES AND PROCESS OF PREPARING THEM

Max Bockmühl, Gustav Ehrhart, and Heinrich Ruschig, Frankfort-on-the-Main-Hechst, Germany, assignors to Winthrop Chemical Company, Inc., New York, N. Y., a corporation of New York

No Drawing. Application November 13, 1935, Serial No. 49,644. In Germany November 17, 1934

14 Claims. (Cl. 260—98)

5. The process which comprises transforming into the acid halide a compound of the following formula:



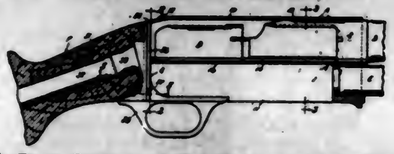
transforming the acid halide into the azide by causing it to act upon an alkali azide, transforming the azide by heating it into the isocyanate and saponifying the latter to form the amine and transforming the amine into the ketone with the aid of an oxidizing agent.

2,106,647

COOLED ATOMIZER FOR SOLID INJECTION ENGINES

Johannes Jan Broese, Delft, Netherlands, assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware

Application June 15, 1937, Serial No. 148,313
In the Netherlands June 22, 1936
5 Claims. (Cl. 299—107.1)



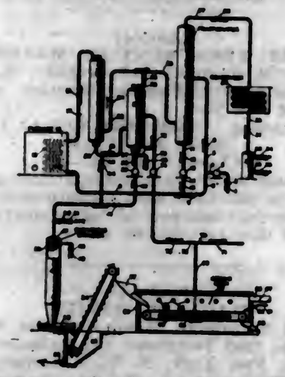
1. A cooled atomizer for internal combustion engines employing solid injection of fuel comprising a valve housing, a spring loaded injection valve therein responsive to periodical increases in the fuel pressure, a fuel space in said housing surrounding said valve, a duct through said housing for supplying fuel to said space, a nozzle of cap-like shape, a recess in said nozzle constituting a continuation of said fuel space, a seat in said nozzle co-operating with the injection valve, an orifice in said nozzle at the bottom of said recess for admitting fuel into the engine cylinder in cooperation with said valve, an inner sleeve integral with said nozzle surrounding said recess and extending into the fuel space having a cylindrical outside to engage the cylindrical inside of said fuel space so as to provide a seal between said inner sleeve and the valve housing, an outer sleeve also integral with said nozzle for affixing the nozzle to the end of the valve housing and a recess in said nozzle between said sleeves having supply and discharge ducts through said housing for circulating cooling liquid through said recess.

2,106,648

REPEATING FIREARM

Val A. Browning, Ogden, Utah, assignor to J. M. & M. S. Browning Company, Ogden, Utah, a corporation of Utah

Application July 27, 1936, Serial No. 92,783
4 Claims. (Cl. 42—4)



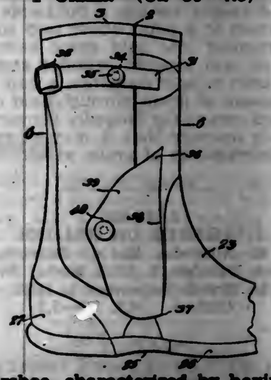
1. In a firearm of the character described, a receiver, a breech block and a barrel extension mounted for reciprocation therein, a removable plate closing the rear end of said receiver and constituting an abutment against which the rear end of said breech block is adapted to engage when the gun is fired, means for securing said plate in the rear end of said receiver, a stock having its forward end engaging the rear end of said receiver, and means for forcing the forward end of said stock against the rear end of said receiver and holding said plate against play with respect to said receiver.

2,106,649

TREATMENT OF HYDROCARBON OILS

Allan H. Calderwood, Martinez, Calif., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

Application June 17, 1935, Serial No. 26,919
2 Claims. (Cl. 196—49)



2. In a process for the treatment of hydrocarbon oils wherein the oil is subjected to conversion conditions of cracking temperature and superatmospheric pressure in a heating coil and communicating reaction chamber, the resulting vaporous and liquid conversion products separated, the latter subjected to further vaporization in a zone of substantially reduced pressure relative to that employed in the reaction chamber, the vaporous conversion products, including those evolved by said further vaporization of the liquids, subjected to fractionation resulting in the formation of reflux condensate, the reflux condensate returned to the heating coil for further conversion, fractionated vapors of the desired end-boiling point subjected to condensation and the resulting distillate recovered, the improvement which comprises withdrawing non-vaporous residual liquid in heated state from said zone of reduced pressure vaporization, passing the same in the form of a relatively fine spray into a quenching chamber, commingling oxidising gas in relatively small regulated quantities with the stream of hot residual liquid passing from said reduced pressure zone to the quenching chamber, contacting said spray with a spray of relatively cold water for the purpose of quenching the same and causing the formation of relatively small particles of semi-solid residual material, removing the latter from the quenching zone and introducing the same into a coking zone, subjecting same in the coking zone to a high temperature whereby to reduce same to substantially dry coke, and returning the hydrocarbon vapors from the coking zone to said reduced pressure vaporizing zone.

2,106,650

OVERSHOE

Edward F. Casey, Malden, Mass., assignor to Converse Rubber Company, Malden, Mass., a corporation of Massachusetts

Application February 28, 1936, Serial No. 66,211
1 Claim. (Cl. 36—7.3)

An overshoe, characterized by having an upper composed of a single sheet of elastic rubber and liner, having a vertical seam between two opposed edges thereof at the rear, a vertical slit from the mouth of the overshoe extending almost to the bottom, on the outer side of the shoe, a soft V-shaped fabric gusset having its edges and point attached along the margins and around the bottom of said slit, a triangular tab, having one edge attached to said upper along the lower part of the forward edge of said slit, whereby the upper may be stretched and drawn snugly over the foot, and its apex having fastening means, cooperating fastening means on the rearward lower portion of the upper to engage said tab fastening means, in such stretched position, and an adjustable fastening means attached to the upper, along the forward edge of said slit, near the mouth of the shoe and cooperating fastening means attached to the rearward portion of the upper to engage said adjustable fastening means.

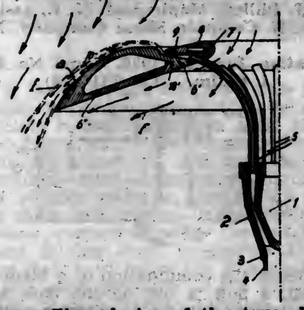
2,106,651

COIN CHUTE

George L. Cherry, Western Springs, and Valentine H. Dupre, Oak Park, Ill., assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

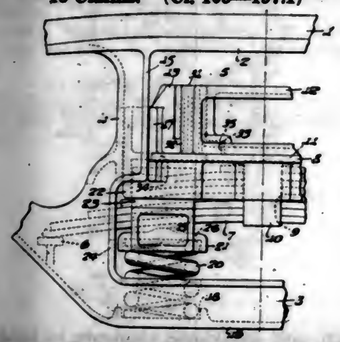
Application August 14, 1936, Serial No. 95,994
5 Claims. (Cl. 232—44)

3. A multi-channel coin chute for telephones, comprising a member having open coin channels formed in one side thereof, a cover member for retaining coins in said channels, a plurality of elements carried by one of said members, each having a shouldered end portion, the other of said members having elongated slots interlocking with said shouldered elements to hold said members in predetermined assembled relation, and a projection on one of said members arranged to engage in a slot formed in the other of said members when said members are interlocked for locking the members together.



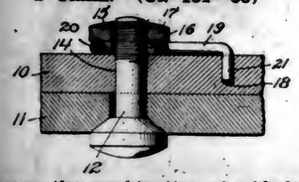
2,106,652

PROPELLING DEVICE



Henri Coanda, Clichy, France, assignor to Société Anonyme d'Etudes des Brevets et Procédés Coanda-Société Coanda, a corporation of France

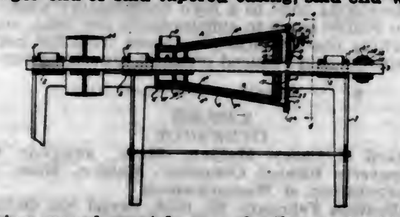
Application January 10, 1936, Serial No. 58,471
In France January 15, 1935
10 Claims. (Cl. 244—72)



1. A propelling device of the type described, which comprises, in combination, a body, an annular member rigid with said body at the front part thereof, another annular member rigid with said body, coaxial with the first annular member and located ahead thereof, so as to leave between said members a narrow annular interval with a flaring outlet opening to the atmosphere in a frontward direction, the rear edge or lip of said outlet, formed by the front surface of the first mentioned annular member, being of rounded shape starting tangentially to said frontward direction on the outer side thereof, with its convexity toward the front, whereas the front edge or lip of said outlet, formed by the front surface of the second mentioned annular member, starts at an angle to said direction on the inner side thereof, and means for driving out a fluid under high pressure through said annular outlet.

2,108,653
RAILWAY TRUCK
Glenn F. Couch, Rochester, N. Y., assignor to The Symington-Gould Corporation, Rochester, N. Y., a corporation of Maryland
Application November 2, 1934, Serial No. 751,203
13 Claims. (Cl. 105—197.1)

7. In a railway truck, in combination, a side frame formed with compression and tension members spaced at intermediate portions by guide columns, leaving a bolster opening therebetween, a semi-elliptic spring supported by means of said tension member, coil springs supported one between each end and the center of said semi-elliptic spring and vertically disposed with respect to said spring, a bolster, a bolster-supporting saddle casting upheld under light load by said semi-elliptic spring only and by all of said springs upon sufficient increase in the bolster load.



2,108,654
NUT LOCK FOR SHEARS AND THE LIKE
Charles J. Dalley, Maplewood, N. J., assignor to The W. H. Compton Shear Company, Newark, N. J.
Application June 24, 1936, Serial No. 86,946
1 Claim. (Cl. 151—38)

In a shears, the combination of a blade receiving a bolt, a bolt, a nut on the bolt, said nut having a circular part on its exterior, and a wire clip having a loop on one end, said loop having a normal inside diameter slightly less than the diameter of the circular part of the nut, the blade having a recess in it, the wire having its other end formed into a stud to enter the recess and act to hold the clip against turning when the nut is screwed on the bolt and the circular part of the nut spreads the loop into gripping relation with the nut.

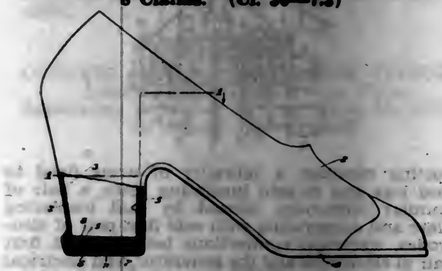
2,108,655
DEGERMINATOR
Henry Clay Dempsey, Decatur, Ill., assignor to The Beall Improvements Company, Inc., Decatur, Ill., a corporation of Illinois
Application June 29, 1936, Serial No. 87,966
1 Claim. (Cl. 83—31)

A degerminator comprising a supporting frame, a shaft supported for rotation by said frame, a tapered cylinder mounted on said shaft and rotatable therewith, a tapered casing which encloses said cylinder, the circumferential face of said tapered cylinder and the adjacent wall of said casing being spaced apart from each other to provide a space through which the grain being treated passes, cone-shaped projections on said spaced apart faces of said tapered cylinder and said tapered casing, an end wall at the larger end of said tapered cylinder, an end wall at the larger end of said tapered casing, said end walls

being spaced apart from each other and said end wall of said casing having a discharge opening formed therein at a point above said shaft, projections extended into said space between said end walls of said tapered cylinder and tapered case from both of said elements, a gate for controlling passage of grain through said discharge opening, and means for hingedly supporting said gate in such manner that it may be opened by pressure thereagainst of grain within the apparatus.

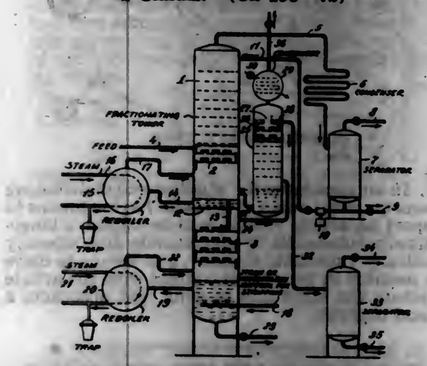
2,108,656
OVERSHOE OR GALOSH
Joaquin de Neronha, Rio de Janeiro, Brazil
Application October 2, 1935, Serial No. 43,166
In Brazil November 1, 1934
5 Claims. (Cl. 36—7.3)

1. A rubber galosh adapted to be put upon the outside of a leather shoe and comprising the combination, with a sole portion, of an oversized upper which is maintained out of contact with the vamp of said shoe when the galosh is in position on the shoe, and a web of live resilient rubber upon said oversized upper disposed across the top of the shaft thereof, said web having an aperture at the middle approximately half as large as the aperture in a conventional or known type of galosh.



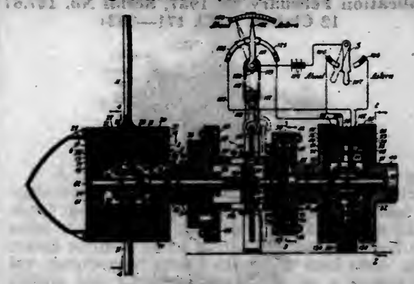
2,108,657
SHOE FORM
William J. De Witt, Auburn, N. Y., assignor to Shoe Form Co., Inc., Auburn, N. Y., a corporation of New York
Application September 5, 1935, Serial No. 39,281
5 Claims. (Cl. 12—128.1)

1. A shoe form comprising a hollow walled toe member and a back part member, the rearward



end of the back part member being adapted to engage the heel counter of a shoe, the toe member including a cone and the back part member having its forward end secured to the cone and including an intermediate portion which rests upon the inner sole of a shoe, when the form is inserted therein, whereby the back part member in engagement with the heel counter tends to elevate the cone of the toe member.

2,108,658
RUBBER OVERSHOE
Ernest W. Dunbar, Hudson, Mass., assignor to Cambridge Rubber Co., Cambridge, Mass., a corporation of Massachusetts
Application June 17, 1936, Serial No. 85,707
8 Claims. (Cl. 36—7.3)



1. A rubber overshoe having a rubber-covered heel structure, a metal plate in the bottom of the heel cavity, and a tongue extending from said plate and anchored in said heel structure, said tongue being offset from the plane of the plate and extending under the plate across a substantial part of the horizontal dimension of the heel.

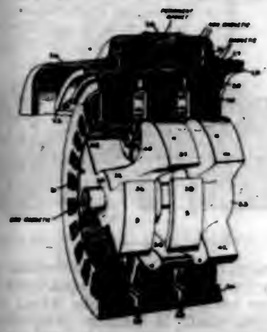
2,108,659
METHOD AND APPARATUS FOR DISTILLATION
George S. Dunham, Augusta, Kans., assignor to Socony-Vacuum Oil Company, Incorporated, New York, N. Y., a corporation of New York
Application August 17, 1935, Serial No. 36,626
2 Claims. (Cl. 196—72)

1. A process for the fractional distillation of hydrocarbons comprising the steps of establishing a stream of material to be fractionated which is heated to a temperature at which it is at least partially vaporized, introducing said stream to a fractionating tower at a point between the ends thereof, rectifying the vapors from said stream by contact with controlled reflux in the portion of the fractionating tower above the point of feed, collecting the liquid portion of the stream in a pool below the point of feed, supplying heat to said pool, permitting liquid from said pool to pass to the stripping section of the fractionating tower without permitting stripping section vapors to enter the rectification section, stripping the light constituents from said liquid in said stripping section by contacting the liquid with a vaporous stripping medium, supplying heat to the lower portion of the stripping section, cooling the stripping section vapors to enable separation from them of the said light constituents as a condensate, subjecting said condensate to controlled fractionation, returning said condensate to the pool maintained in the main tower below the point of feed, and separately removing the stripping medium from the system without permitting its entry into the rectification section.

2,108,660
VARIABLE PITCH AND REVERSING PROPELLER MECHANISM
Stephen A. Farrell, Brooklyn, N. Y., assignor to Acme Propeller Corporation, New York, N. Y., a corporation of New York
Application March 1, 1935, Serial No. 8,952
Renewed October 14, 1936
3 Claims. (Cl. 74—291)

1. In a variable pitch and reversible propeller mechanism, in combination, a rotatable shaft, an intermediate rotatable shaft in axial alinement with the first shaft, a hollow propeller driving shaft through which the first and intermediate shafts extend, speed changing means connected with all of said shafts to change the speed of the first shaft with respect to the driving shaft, and means connected with the intermediate shaft and driving shaft to operate the speed changing means, to cause the first shaft to rotate in the same direction as the driving shaft but faster, or in a reverse direction thereto, in response to the direct rotation of the driving shaft.

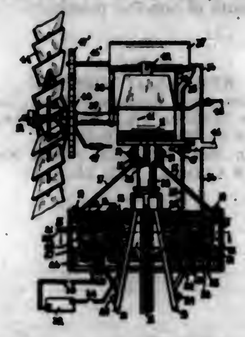
2,108,661
APPARATUS FOR PURIFYING AND AGING LIQUOR
Louis H. Farrier and Richard H. Harlin, Poughkeepsie, N. Y.
Application December 13, 1935, Serial No. 54,169
1 Claim. (Cl. 99—277.1)



A device for maturing, purifying, and flavoring alcoholic liquors, comprising in combination with a container for the liquor having a neck, of a charred oak wood tubular member closed at the lower end and open at the upper end, means for detachably securing the same within the neck of the container, a purifying and aging compound contained within said tubular member, a plug secured in said tubular member above the

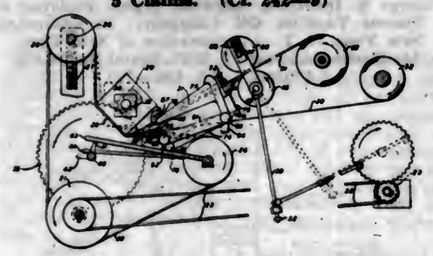
compound, and ducts formed in the wall of said tubular member between said plug and the open

end of the member to establish communication between the interior of the container and its neck through said member.



2,106,662
INDUCTOR DYNAMO-ELECTRIC MACHINE
Alec Fisher, Lynn, Mass., assignor to General Electric Company, a corporation of New York
Application February 25, 1937, Serial No. 127,677
12 Claims. (Cl. 171—252)

1. An inductor-type dynamo-electric machine comprising a plurality, greater than two, of stator elements in axial alignment, a magnetic connection between the peripheries of the outer stator elements, the inner stator element or elements being magnetically segregated from the outer stator elements, and a salient pole rotor structure for said machine providing excitation flux paths from one end stator element to the other end stator element by way of the inner stator element or elements.

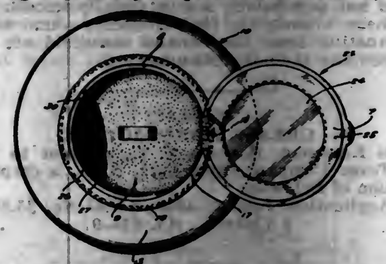


2,106,663
ELECTRODE FOR WINDMILL GENERATORS
Herman Folkers, Omaha, Nebr.
Application November 25, 1936, Serial No. 112,773
2 Claims. (Cl. 290—44)

1. In an apparatus of the character described, a mast having a plurality of supporting legs, a rotatable sleeve carried by the mast, a paddle wheel adapted to be rotated by wind pressure and carried by said sleeve, a generator having an armature and carried by said sleeve, said wheel geared to the armature of said generator for producing electrical energy, a storage battery for said energy disposed remotely from said mast, a supporting member having an aperture for receiving said legs of the mast and so shaped as to have locking engagement with said legs, a horizontally disposed plate supported by said supporting member, a housing carried by said plate, a plurality of arms connected to said housing and to said sleeve, a pair of annular ring electrodes carried by said plate, a plate of insulating material surrounding said legs of the mast below said sup-

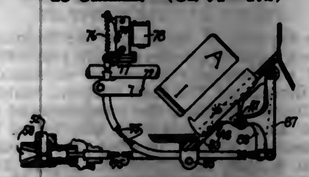
porting member, a plurality of arms fixed to said legs and to said insulating plate, a pair of annular electrodes carried by said insulating plate and cooperating with said first pair of electrodes, electrical connections between said first pair of electrodes and the generator, and electrical connections between the second pair of electrodes and the battery.

2,106,664
APPARATUS FOR WINDING MATERIAL
Erwin E. Franz, Cranford, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Original application February 9, 1935, Serial No. 5,743. Divided and this application December 11, 1935, Serial No. 53,957
5 Claims. (Cl. 242—9)



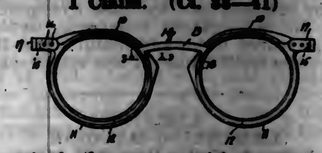
1. In an apparatus for winding and distributing strand material on an article and having means to support an article rotatably to be wound, a longitudinally substantially inextensible and laterally elastically extensible member, and means to drive the member in peripheral contact with the article to rotate the same and to wind and distribute a strand thereon.

2,106,665
VANITY CASE CONSTRUCTION
Thomas M. Gibson, North Attleboro, Mass., assignor to Evans Case Company, North Attleboro, Mass., a corporation of Massachusetts
Application August 13, 1935, Serial No. 35,922
5 Claims. (Cl. 132—82)



1. As an article of manufacture, a powder sifter

having a plurality of perforations therein, the



edges of said perforations having sharp cutting edges.

2,106,666
CONTROL SYSTEM FOR MOTOR VEHICLES
Edwin S. Hall, New Haven, Conn.
Application December 26, 1933, Serial No. 703,959
15 Claims. (Cl. 74—472)

1. A vehicle control system comprising, in combination, an internal combustion engine, means for controlling the fuel feed to said engine, a continuously variable transmission, means for controlling the drive ratio of said transmission, a centrifugal governor responsive to engine speed and operably connected to said drive ratio controlling means to vary the drive ratio of said transmission as a means of maintaining the speed of said engine at a uniform rate, hydraulically operable means for adjusting said governor to cause it to maintain the speed of said engine at a higher rate, an accelerator operable by the driver to accelerate said vehicle, cams associated with said accelerator, a cam follower operably connecting one of said accelerator cams to said fuel feed controlling means, a cam follower operably connecting another of said accelerator cams to said hydraulically operable governor adjusting means.

2,106,667
SPECTACLE FRAME
Moses H. Harris, New York, N. Y.
Application January 15, 1936, Serial No. 59,208
1 Claim. (Cl. 88—41)

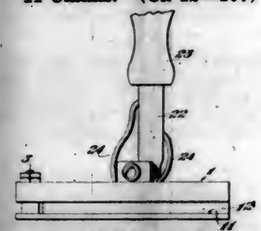
A spectacle frame comprising a pair of non-metallic rims, each rim having its front face formed with a groove extending circumferentially about the rim in spaced relation to inner and outer marginal edges thereof and a recess in its outer end portion leading from the groove, a continuous metal reinforcing ring seated in the groove of each rim and having their inner end portions provided with rearwardly extending pins passing through the rim from the bottom of the groove, a tongue extending from the outer end of each ring and countersunk in the recess of the rim, a bridge extending between said rims and having its ends joined to the rings in close proximity to said pins, and hinge members for bows having forks straddling the outer end portions of the rims and secured by pins passing through the rims and the tongues of the rings.

2,106,668
MECHANICAL PENCIL
Paul S. Hauton, Atlanta, Ga.
Original application August 21, 1929, Serial No. 387,542. Divided and this application September 21, 1932, Serial No. 634,099
5 Claims. (Cl. 120—18)

2. A method of producing a mechanical pencil including laterally bending edges of a thin flat sheet metal strip to form thin flanges along each edge of the strip, then tightly coiling the flanged metal strip to form an internally threaded tubular member of small diameter and then snugly fitting the tightly coiled tube in a casing bore, the bore being of substantially the same diameter as the outside diameter of the tubular member whereby the tubular member is prevented from uncoiling and the edges of the coils are maintained in contact.

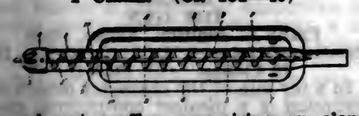
3. A mechanical pencil comprising a casing having a reduced cylindrical end, the cylindrical end forming a shoulder and an axial internally threaded bore in the casing coextensive with the casing and reduced end, a slotted rotatable feed tube in the casing bore having a split end forming locking prongs, an inverted thimble journalled on said reduced end, having an opening engaged by said prong to lock the thimble and slotted tube together, the lower circumferential edge of the thimble riding on the shoulder, and a manually operable sleeve of substantially the same outside diameter as the casing frictionally fitting the outside of said thimble and projected above the upper end thereof to conceal the end of the thimble.

2,106,669
TOY GUN
Frank L. Johnson, Akron, Ohio
Application October 2, 1936, Serial No. 103,657
10 Claims. (Cl. 124—16)



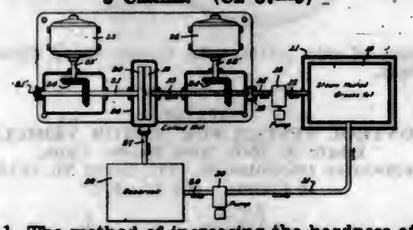
1. In a toy gun of the character described, the combination of a member constituting the butt of the gun, and a member constituting the barrel thereof, said barrel member being slidably mounted in said butt member and comprising

means for holding an elastic band under tension, said band being disengaged from said barrel



member by movement of the barrel member as a whole relatively of the butt.

2,108,670
APPARATUS FOR LASTING SHOES
Jacob Simon Kamborian, West Newton, Mass., assignor to Northern Machine Co., Inc., Waltham, Mass., a corporation of Massachusetts
Application June 7, 1935, Serial No. 25,407
11 Claims. (Cl. 12—107)



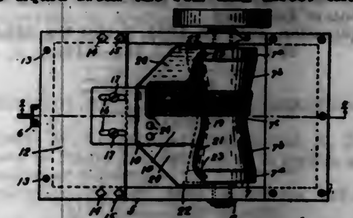
1. A pressure applying tool for use in a lasting machine including last supporting means and actuating devices movable toward the last bottom and also toward the median line of the last from opposite sides of the latter, said pressure applying tool comprising a pair of complemental curved elongate narrow members each shaped to conform substantially to the contour of the margin of one side of the forepart and toe portion of an insole, means so uniting said members as to permit them to move toward and from each other thereby to vary the effective width of the tool, means for heating said curved members, each of said members having a substantially flat bottom surface and being devoid of provision for attaching it to the insole, each member having a recess for the reception of one of said actuating devices of the lasting machine, whereby the constituent curved members of the pressure applying tool may be moved toward the bottom of a shoe mounted on the last and concomitantly caused to approach each other thereby to flatten and wipe in the margins of the shoe upper.

2,108,671
MUFFLER OF INTERNAL COMBUSTION ENGINES
Kihachi Kato, Tokyo, Japan, assignor of seven-tenths to Gonsaburo Ishibashi, Tokyo, Japan
Application December 27, 1934, Serial No. 759,334
In Japan December 27, 1933
1 Claim. (Cl. 181—49)

An exhaust muffler comprising an elongated cylindrical tube, a rod in said elongated tube, a helical plate around said rotatable rod, said helical plate being centrally corrugated adjacent said rod and having a substantially smooth periphery, whereby the high frequency sound waves emanating from the exhaust manifold are reduced and the noise extinguished.

2,108,672
GREASE MANUFACTURE
Gus Kaufman, Beacon, N. Y., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
Application June 7, 1935, Serial No. 25,361
3 Claims. (Cl. 87—9)

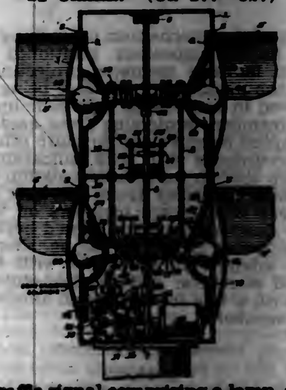
1. The method of increasing the hardness of a soda base grease of fibrous texture and water content not substantially in excess of about 1.5%, without increasing the soap content, which comprises, after completing the operations of saponifying the fat and mixing with mineral oil to form a homogeneous grease, passing the homogeneous grease in a thin film between highly rotating, closely spaced smooth surfaces where the grease is thrown outwardly by centrifugal force while being subjected to a shearing action, with resultant substantial decrease in the A. S. T. M. penetration of the grease, and then passing the grease without further treatment to a zone of collection for packaging for use.



2,108,673
MANUFACTURE OF RUBBER AND RUBBER-LIKE ARTICLES
Walter Kay, Bury, England, assignor to Kaysam Corporation of America, Dover, Del., a corporation of Delaware
No Drawing. Original application November 1, 1932, Serial No. 640,650. Divided and this application July 6, 1935, Serial No. 30,169. Renewed June 2, 1937. In Great Britain November 5, 1931
3 Claims. (Cl. 18—50)

1. In a process of making an article of rubber, the steps comprising mixing with concentrated, or thickened aqueous dispersion of rubber containing magnesium oxide and trisodium phosphate, ammonium chloride providing sufficient positively charged ions to cause irreversible setting of the mix without syneeresis, casting the mix to a desired form, and maintaining the mix in such form until it has set to a stable condition.

2,108,674
CEMENTING MACHINE
Irving L. Keith, Haverhill, Mass.
Application December 12, 1935, Serial No. 54,188
3 Claims. (Cl. 12—30)



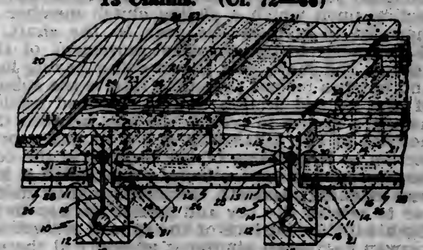
1. In a machine for the purpose described, a liquid containing tank, a roll mounted to rotate therein about a horizontally disposed axis, with its lower portion submerged in the liquid, means to rotate said roll continuously in one direction, to provide a film of liquid on an unsubmerged portion of its surface, and a scraper comprising

a horizontally extending plate having its edge in operative engagement with the downgoing side of the roll and arranged to extend from the roll at an upward inclination in position to remove liquid from the roll and direct the flow

thereof away from the roll and toward the top side of the scraper in a stream of substantial depth, said scraper being arranged to provide a discharge passage back into the tank at a substantial distance from the roll.

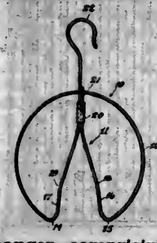
2,108,675
TRAFFIC SIGNAL LIGHT
Joseph Kiss, River Forest, Ill.
Application July 26, 1935, Serial No. 33,228
11 Claims. (Cl. 177—327)

1. A traffic signal comprising a lamp, a reflector mounted behind said lamp, said reflector having a circular peripheral margin and said lamp being mounted concentrically with respect to said margin, means to energize the lamp for operation throughout a predetermined interval during the operating cycle of the signal, said lamp being inactive during a succeeding portion of said operating cycle, said reflector comprising a rotatable dished element, said reflector being mounted in position with respect to the lamp and shaped to reflect light from said lamp forwardly, means to rotate the reflector about an axis located centrally of said peripheral margin, and means carried by and rotating with said reflector and operable to provide a visible index circulating about the lamp and affording a visual indication of the progress of the operating cycle of the signal.



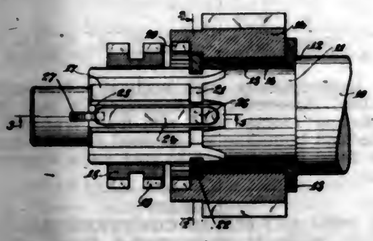
2,108,676
OSCILLATION RESTRAINT MECHANISM FOR LOCOMOTIVES OR CARS
Ole K. Kjelseth, Erie, Pa., assignor to General Electric Company, a corporation of New York
Application July 30, 1936, Serial No. 93,849
11 Claims. (Cl. 105—174)

11. A locomotive or car having a main supporting frame, an auxiliary truck having a frame, laterally movable means for supporting said main supporting frame on said auxiliary truck frame, and means including an oscillation restraint mechanism connected to an end of said auxiliary truck frame and having a laterally fixed



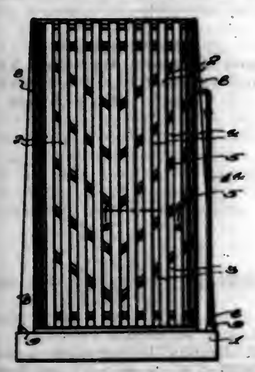
and longitudinally and vertically translatable non-load transmitting connection to said main supporting frame, said non-load transmitting connection including a universal joint longitudinally fixed with respect to said main supporting frame.

2,108,677
PRECAST FLOOR CONSTRUCTION
Henry O. Klotz, Bethel, Conn.
Application March 21, 1936, Serial No. 70,093
13 Claims. (Cl. 72—66)



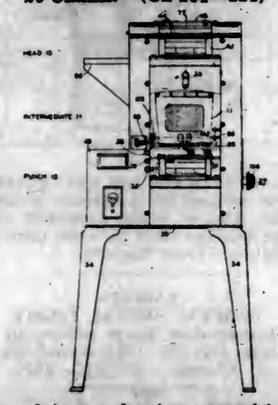
12. A roof or floor construction comprising a girder including a pair of precast cementitious joists each having side shoulders intermediate its height, floor joists at the sides of said girder and having their ends resting on the outer shoulders of the girder joists, tie bars extending from said floor joists into the space between the girder joists, and a cementitious filler in said space and enclosing said tie bars and securing all the parts together.

2,108,678
HAT HANGER
Ferdinand Kulhawy, West New York, N. J.
Application November 16, 1936, Serial No. 110,993
2 Claims. (Cl. 211—32)



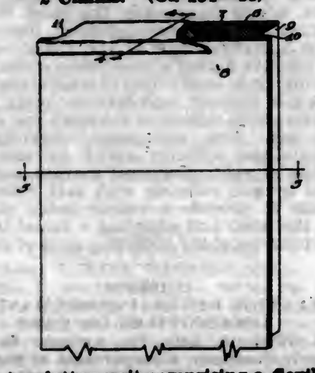
1. A hat hanger comprising a compressible member formed of a loop of resilient material, said loop being of a size and shape to engage and exert pressure against the inside of a hat throughout the greater portion of the circumference thereof when compressed, the ends of said loop being spaced apart to permit compression of the loop, and the ends of said loop extending outwardly from the loop at an angle to provide a handle for compressing the loop and having a hook connected to the handle whereby the hanger may be suspended.

2,108,679
THRUST COLLAR
Aladar Kurti, Highland Park, N. J., assignor to Mack Manufacturing Corporation, a corporation of Delaware
Application May 12, 1936, Serial No. 79,291
1 Claim. (Cl. 308—135)



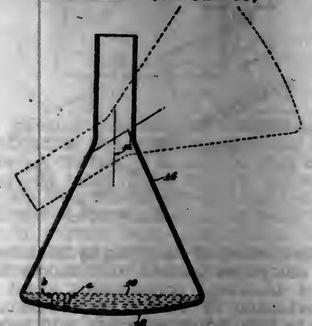
In combination with a shaft having a gear mounted rotatably thereon and having a splined section upon which a sliding clutch member is mounted to connect the gear to the shaft, a thrust collar to prevent axial movement of the gear on the shaft, said thrust collar having lugs and notches formed therein to receive the splines of the splined section and the splined section having a groove to receive the lugs between the notches of the collar, and a key having a projection to engage one of the notches in the collar, the splined section being formed with a key way extending beneath the sliding clutch member to receive the key and permit the key to lie flush with the surface of the splined section the keyway having an abutment at one end thereof to prevent axial motion of the key, whereby the sliding clutch member will hold the key in position.

2,108,680
COOLING TOWER
Ray Lakey, Denton, Tex.
Application October 1, 1936, Serial No. 103,488
4 Claims. (Cl. 261—110)



1. A water cooling tower including a wall structure including vertically disposed and relatively spaced baffles constituting outer and inner walls, members disposed in V-formation for separating said walls, to which said baffles are secured, and whose longitudinal upper and lower surfaces are obliquely cut to direct the water inwardly of said tower the contiguous ends of said members being disposed to provide passages to drain the surfaces of said members.

2,108,681
CONVERTING AND TRANSLATING PUNCH
William W. Lasker, Brooklyn, N. Y., assignor to Remington Rand Inc., Buffalo, N. Y., a corporation of Delaware
Application July 18, 1933, Serial No. 680,922
20 Claims. (Cl. 164—114)



1. A translator mechanism comprising a frame member having oppositely positioned parallel faces, and movable members projecting therethrough, the members of one face being adapted to be moved in accordance with code indications and the members projecting from another face being adapted to move and to move other members in accordance with code indications, and a mechanism therein for code translation comprising members extending from alternate members on one face to adjacent members on the other face, and short members interposed between said first mentioned members having thereon flag members adapted to cooperate with said first mentioned members, and simultaneously to cooperate with a flag member upon another of the through members.

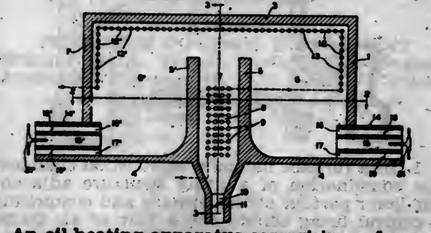
2,108,682
INSULATING MATERIAL
Frank R. Leslie, St. Paul, Minn.
Application December 4, 1936, Serial No. 114,185
2 Claims. (Cl. 154—44)

1. An insulating unit comprising a flexible, vapor permeable, fibrous core, a tubular, flexible, vapor proof envelope enclosing said core and leaving end portions thereof exposed, the end portions of the envelope and the core being coplanar and a coating of viscous vapor proof sealing material over the exposed portions of the core in embedding engagement therewith, said coating extending to the end portions of the envelope in sealing engagement therewith whereby said core is positively supported with respect to said envelope.

2,108,683
METHOD OF MAKING FLUORESCENT SCREENS
Humboldt W. Leverenz, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 23, 1934, Serial No. 727,134
8 Claims. (Cl. 91—68)

1. The method of applying a fluorescent screen to a base member therefor, comprising placing in a low viscosity, high surface tension electrolyte solution separate nonaggregate particles of fluorescent material which may be shaken into homogeneous distribution throughout the solution and which will then settle under the influence of gravitational force, said solution being non-reacting with respect to the material, the size of the individual particles being such that their distribution throughout the solution would be influenced substantially in accordance with the physical principles of colloidal phenomena, the solution being characterized by the fact that the ionic dissociation constant of the electrolyte is greater than 10^{-10} whereby the dissociated ions are effective to substantially remove the influence of the physical principles of colloidal phenomena with respect to electrical charging of the particles as they settle, and permitting the particles to settle upon and attach themselves to the base member to form thereon a uniform fluorescent screen.

2,108,684
COFFEE MAKER
John W. Lynch, Chicago, Ill., assignor to Chicago Flexible Shaft Company, Chicago, Ill., a corporation of Illinois
Application August 6, 1936, Serial No. 94,561
4 Claims. (Cl. 210—162)

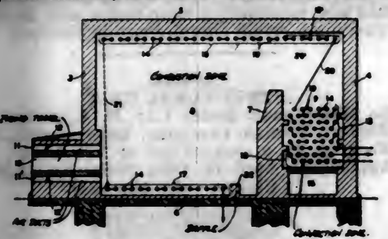


4. The combination in a coffee maker having spaced chambers, and a conduit therebetween having an internal annular shoulder, of a filter comprising a filter fabric in the form of a bag having a drawstring, a resilient frame of wire loops for holding the bag in the shape of a short cylinder, said frame having spring elements positioned and tensioned to snap under said shoulder to yieldingly retain the strainer in position.

2,108,685
STRUCTURAL UNIT
John McDonough, Jersey City, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application April 10, 1935, Serial No. 15,509
11 Claims. (Cl. 189—34)

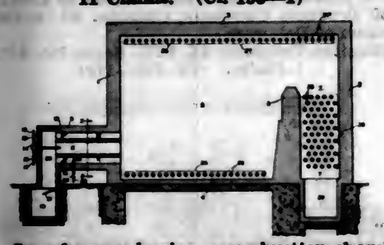
9. A structural unit comprising a sheet shaped member, a generally tubular and longitudinally slotted sheet metal edge unit enclosing an edge of the member, and means to secure the edge unit to the member comprising a block having a shape to substantially fill the cross-section of the edge member positioned within the edge unit and attached to the member.

2,108,686
HEATING OF FLUIDS
Lev A. Mekler, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application December 14, 1932, Serial No. 647,167
1 Claim. (Cl. 196—110)



An oil heating apparatus comprising a furnace having side walls, end walls, a roof and a floor, a pair of spaced bridge walls dividing the furnace into two outer compartments and a central compartment, a plurality of horizontally spaced fuel ducts, each provided with a burner, extending through each of said side walls adjacent the floor and adapted to project at least partially burned fuel toward one of said bridge walls, air ducts contiguous to and positioned above and below each of the fuel ducts, means for passing combustion gases from both said outer compartments through the central compartment, heating tubes in each of the outer compartments disposed out of the main path of combustion gases therethrough, and additional heating tubes in the central compartment disposed in the path of the combustion gases therethrough.

2,108,687
HEATING OF FLUIDS
Lev A. Mekler, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application October 24, 1933, Serial No. 694,960
12 Claims. (Cl. 122—356)

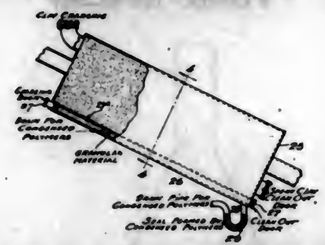


1. In a furnace, for the heating of fluids, having side walls, end walls, a roof and a floor, and

a combustion and heating zone, the combination of a firing tunnel communicating with said combustion and heating zone, through which a partially or completely burned fuel-air mixture is supplied thereto, means for separately introduc-

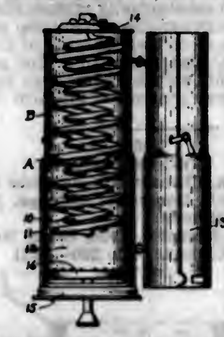
ing regulated quantities of additional air to the combustion and heating zone above and beneath the firing tunnel, a fluid conduit located adjacent the roof of the furnace, and a fluid conduit located adjacent the floor of the combustion and heating zone.

2,106,688
FURNACE
Lev A. Mekler, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application October 12, 1934, Serial No. 748,246
11 Claims. (Cl. 158—1)



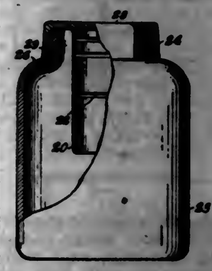
1. In a furnace having a combustion chamber, the combination of a firing structure adjacent the lower portion of the furnace and comprising a central firing tunnel and a pair of air ducts, one disposed above and the other below the central tunnel, means for supplying a controlled mixture of combustible fuel and air through said central firing tunnel to said combustion chamber of the furnace and means for separately supplying independently controlled amounts of additional air to the combustion chamber through each of said air ducts.

2,106,689
COLLAPSIBLE TUBE
Hugo Meck, New York, N. Y.
Application February 10, 1937, Serial No. 125,013
9 Claims. (Cl. 221—60)



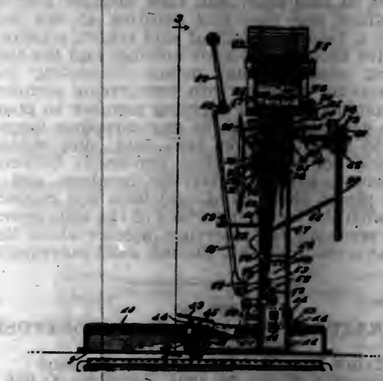
1. A collapsible tube having a cylindrical body and a rounded bottom closing said tube and integral with said body, the ends of the open portion of said tube being compressed together, said ends having confronting bulged portions, a clamping piece forcing said ends together in parallel relation, and an opening in said clamping piece alining with said bulged portions by which the contents of said tube may be extruded.

2,106,690
METHOD FOR VAPOR PHASE TREATMENT OF PETROLEUM DISTILLATES
Henry S. Montgomery, South Pasadena, Calif., assignor of one-half to Alfred W. Knight, San Marino, Calif.
Application March 30, 1932, Serial No. 602,096
5 Claims. (Cl. 196—96)



1. The method of purifying hydrocarbon vapors which comprises passing such vapors through a body of adsorbent polymerizing agent to cause polymerization of certain constituents of said vapors to form liquid polymers, said vapors being caused to pass through said adsorbent body in such manner as to cause said liquid polymers to drain from said body through paths shorter than the vertical free-fall path of the polymers and at an angle to said vertical free-fall path, said adsorbent body being disposed at an angle to the vertical and inclined to the horizontal, and said vapors being passed through said body in an upward direction.

2,106,691
WATER HEATER
Joseph F. Mustee, University Heights, Ohio
Application August 8, 1936, Serial No. 95,010
3 Claims. (Cl. 122—250)

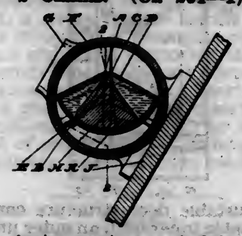


1. A baffle comprising a body portion or plate substantially the shape of a disc having a cut out portion in one edge, and a resilient member projecting from one side of said plate, said plate adjacent to but at one side of the cut out portion being raised above the general plane thereof and at the other side of the cut out portion being depressed below the general plane of the plate.

2,106,692
CONTAINER CLOSURE
Carl Edward Pleak, Covington, Ky.
Application May 9, 1935, Serial No. 20,637
16 Claims. (Cl. 221—147)

1. An integral combination comprising a jar cap, a depending flange thereon, internal threads on the flange thereof, a measuring cup depending from the inner head surface thereof and equi-distant from the flange, said cup being thin and flexible, the entire combination being molded of synthetic organic resin material and adapted to seal a jar by pressure of the inner head surface of the jar cap on the top edge of the jar.

2,106,693
TRAP DRUM, CYMBAL, AND TRIANGLE BEATER
Jesse M. Sewell, Villegreen, Colo., assignor of one-half to Ole E. Sewell, Leadville, Colo.
Application November 4, 1935, Serial No. 48,220
4 Claims. (Cl. 84—423)

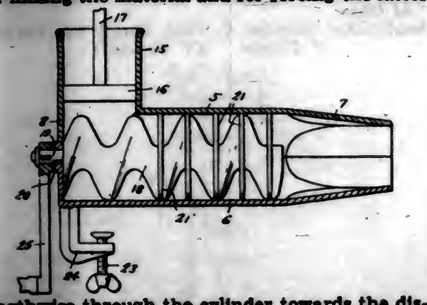


1. In a device of the class described, a platform, a hollow column having slots and secured to and extending upwardly from the platform, a beater pivoted at the lower end on the column and extending upwardly along the front of the column, a drumstick secured to the beater, a beater pivoted at the lower end on the column and extending through said slots in the column to project from the rear of the column, lever mechanism operatively connecting both beaters together, and a spring controlled pedal pivoted on the platform and operatively connected to said lever mechanism for actuating the beaters simultaneously.

2,106,694
ARTICLE FEEDING DEVICE
Alexander M. Smith and Lawrence H. Strayer, Kent, Ohio, assignors to The Lamson & Sessions Company, Cleveland, Ohio, a corporation of Ohio
Application October 6, 1936, Serial No. 104,251
2 Claims. (Cl. 10—167)

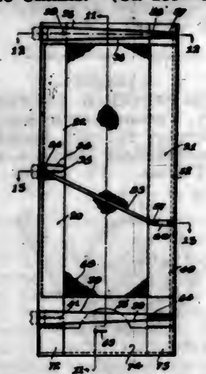
1. In article feeding apparatus, a hopper, a conveying means extending therefrom, a pair of reciprocable members operable to deliver articles from the hopper to the conveying means, and means for limiting the stroke of one of said members to render the same ineffective and thereby reduce the rate of feed.

2,106,695
PENDULUM CONTROL INSTRUMENT
William Tapley, Totton, Southampton, England
Application February 26, 1937, Serial No. 128,036
In Great Britain March 5, 1936
2 Claims. (Cl. 264—1)



1. In an instrument operated by movements of a magnetic pendulum relative to a fixed element of the instrument, a non-magnetic mass attached to the magnetic pendulum for causing the pendulum to assume positions under the action of gravity that the magnetic poles of said pendulum will, throughout their movements, be retained remote from any exterior magnetic substance near or upon which the instrument may be mounted.

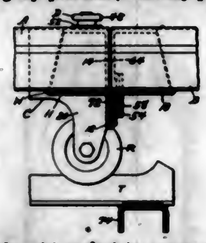
2,106,696
MIXING AND MOLDING DEVICE
Franklin M. Troutner, San Jose, Calif.
Application October 24, 1935, Serial No. 46,595
Renewed November 2, 1937
2 Claims. (Cl. 31—25)



1. In a device of the character described, an elongated cylinder having a tapered end terminating in a substantially square discharge opening, a hopper connected with the cylinder at the

end remote from said discharge opening, a plunger mounted for reciprocation in the hopper for forcing material from the hopper into the cylinder, an auger rotatably mounted in the cylinder for mixing the material and for forcing the latter

lengthwise through the cylinder towards the discharge end of the latter, a plurality of perforated disks mounted in spaced relation in advance of the discharge end of the auger and through which the material is forced to pass, and means interfitting said disks with the vanes of the auger.

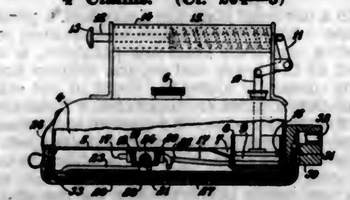


2,108,697
DOOR STRUCTURE
Arthur A. Van Atta, Marion, Ohio
Application April 20, 1936, Serial No. 75,469
13 Claims. (Cl. 189—46)

1. An adjustable door structure comprising a bodily adjustable inner unit, an outer unit adapted to be hinged to a support having a door opening and including superposed means for extension across the door opening in spaced relation to the support, said inner unit arranged rearwardly of the outer unit for closing the door opening, said units having oppositely disposed spaced coacting means to permit the bodily adjusting of the inner unit relative to the outer unit and for detachably securing the inner unit in its adjusted position against the rear of the outer unit.

2,108,698
SHAKER CHUTE CONSTRUCTION
Charles F. Walp, Berwick, Pa., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey
Application July 31, 1935, Serial No. 34,021
8 Claims. (Cl. 198—220)

2. In a shaker chute, abutting trough sections, a trough conforming element secured to one of the sections, means secured to said element to provide an upwardly opening tapered socket, a second trough conforming element secured to the other trough section and formed with a downwardly tapering lip portion, said lip portion being



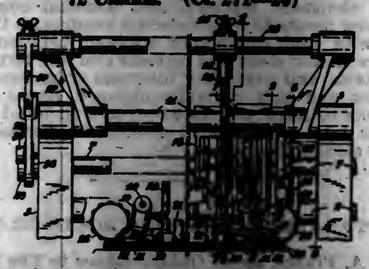
engageable with said socket to connect the trough sections together, and wedge members carried by one of said elements, said wedge members being also engageable with said other element to force the lip and socket into trough connecting position.

2,108,699
BORING BAR
Fritz Walther, Plauen i. V., Germany
Application July 31, 1935, Serial No. 34,086
In Germany August 11, 1934
4 Claims. (Cl. 77—56)

1. A boring bar for operation between two centers comprising a driving member, a tool carrying member having an axial bore at one end in which one of the centers engages a slide member in said bore, said slide member having an inclined side face and abutting at one end against a flattened point of said center, a spring operative between the slide member and the tool carrying member, joint means connecting the tool carrying member with the driving member and enabling the tool carrying member to pivot in the driving member in any direction transverse to their common axis, said joint means providing for limited axial movement between said driving and tool carrying members, and a thrust pin in the wall of said bore and cooperating with the inclined surface of the slide member to pivot the tool carrying member about the joint as a result of said limited axial movement.

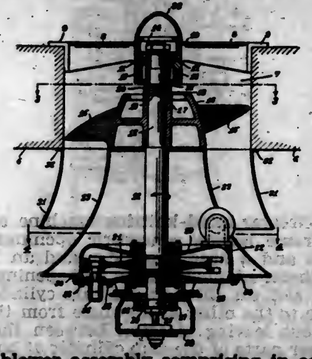
2,108,700
APPARATUS FOR THE ELECTRODEPOSITION OF METALS
Ralph Harold Adey, London, England
Application March 26, 1936, Serial No. 71,035
4 Claims. (Cl. 204—5)

1. A device for use in effecting the electrodeposition of metal comprising as a unitary



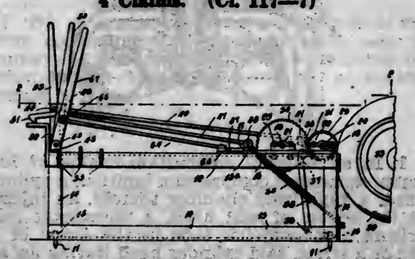
structure, an electrode formed from the metal to be deposited, an absorbent pad adapted to come between said electrode and the surface receiving the deposit, a reservoir for an appropriate electrolyte on which reservoir said pad and said electrode are mounted, a pair of conduits having delivery openings situated at different positions with respect to the absorbent pad, manually operable pump means integral with said reservoir for transferring the electrolyte from the reservoir through said conduits to the absorbent pad and a gravity operable valve capable of occupying either one of two different positions for rendering inoperative either one or the other of said pair of conduits, accordingly as the device is held in one position or another.

2,108,701
MECHANICAL SEAL
Walter Edward Amberg, Chicago, Ill., assignor to Fred Milton Friedloh, Chicago, Ill.
Application July 13, 1936, Serial No. 90,209
2 Claims. (Cl. 286—11)



1. A sealing device for a rotary shaft comprising a stationary bushing surrounding the shaft, a thrust bearing plate surrounding the shaft adapted to engage one end of the bushing to establish a seal therewith and having a pitched propeller blade adapted when the bearing plate is rotated to act upon a fluid in which said device is immersed to advance the bearing plate against the proximate bushing end, and a flexible sealing and driving connection between the plate and shaft whereby the former is caused to rotate with the latter.

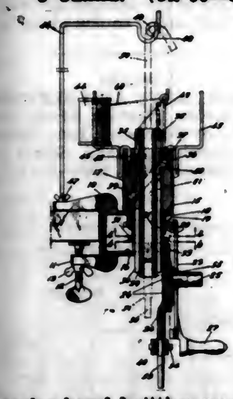
2,108,702
AUTOMATIC SHEET FEEDING MACHINERY
Headley Townsend Backhouse, St. John's Wood, London, England
Application August 4, 1934, Serial No. 738,500. Renewed February 25, 1936. In Great Britain October 26, 1933
72 Claims. (Cl. 271—20)



1. A sheet-feeding machine comprising means for supporting a pile of sheets, a set of suction devices mounted above the pile, means to cause the suction devices first to move downwardly towards the pile and to grip the uppermost sheet and then, while gripping the sheet, to move upwardly from the pile to lift the sheet, a set of arms pivoted for oscillation about an axis remote from the pile, a set of levers pivoted to the arms remote from the axis aforesaid, a frame member on which the levers slide and a second set of suction devices carried on the levers, above the pile, and arranged to receive and grip the sheet lifted by the first set towards the end of the lifting movement, and means to oscillate the arms about the axis aforesaid to cause forwarding movement of the suction devices while gripping the sheet and return movement after the sheet has been released, the frame member being remote from the connections of the levers to the arms so as to maintain the axes of the suction devices at a substantially constant angle to the plane of the pile.

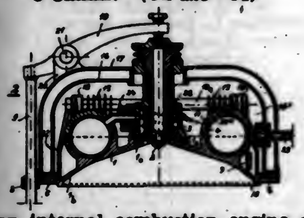
2,108,703
BLOWER DRIVE AND SUPPORT
Oliver D. H. Bentley, Norfolk, Mass., assignor to B. F. Sturtevant Company, Inc., Boston, Mass.
Application December 7, 1935, Serial No. 53,369
7 Claims. (Cl. 230—116)

1. A blower assembly comprising in combination, a vertical shaft, blower blades mounted on said shaft, a steam turbine having rotating and stationary structure, a bearing around the lower end of said shaft and supported thereby, means for supporting the stationary structure of said turbine around and from said bearing, means for preventing the rotation of said stationary structure around said bearing, a thrust bearing at the upper end of said shaft, and means for supporting said blower assembly from said thrust bearing.



2,108,704
ROPE MAKING MACHINE
William L. Butcher, Decorah, Iowa
Application March 25, 1937, Serial No. 133,049
4 Claims. (Cl. 117—7)

1. A machine of the class described provided with twisting hooks, shafts operating said hooks, means to operate one of the shafts, gearing to



drive one shaft from the other and in the opposite direction, one of said shafts having a driving drum thereon for frictional contact with a driving wheel, and brake means co-acting with the drum.

2,108,705
CIRCULAR HAND-KNITTING MACHINE
Sampson Breadwin, Brooklyn, N. Y., assignor to Almadie Knitting Machine Co., Inc., Brooklyn, N. Y., a corporation of New York
Application April 21, 1936, Serial No. 75,595
5 Claims. (Cl. 66—8)

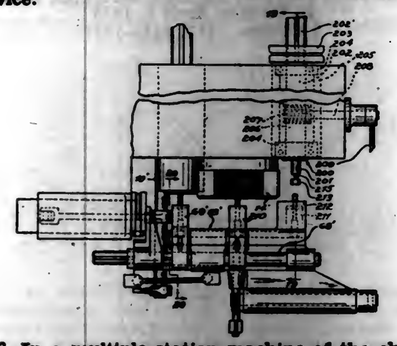
1. A circular hand-knitting machine comprising a frame having concentric openings therethrough and a needle cylinder and an integral cam cylinder adapted to fit in said openings, there being a slot cut through the cam cylinder from one side to the other at an angle from the horizontal but leaving material between the upper and lower parts of the cam cylinder at both sides thereof to act as a complete cam path for the needle butts, in combination with a metal insert in said slot to provide bearing surfaces for the butts.

2,108,706
CYLINDER HEAD FOR INTERNAL COMBUSTION ENGINES, FOR THE PREVAPORIZATION OF LIGHT FUEL AND FOR CRACKING OF HEAVY OILS
Marcel Victor Crillon, Marseille, France
Application June 8, 1935, Serial No. 25,652
In France September 11, 1934
3 Claims. (Cl. 123—34)

1. In an internal combustion engine of high compression and compression ignition, a cylinder head, a vaporizing chamber therein, an injector at the center of said head, a thermostat comprising a manometric tube in the shape of an arc of a circle, said cylinder head having an annular groove to receive said tube, a counter-head forming with said cylinder head a housing, a fuel vaporizing tube in said housing, a duct from said vaporizing tube to said injector, a curved surface on said counter head to which one of the extremities of said manometric tube is attached, two covers on said cylinder head to form a cooling chamber between them and the upper surface of said counter head, said covers having openings for admission of fresh air, and actuating means for said shutter to which means the other extremity of said manometric tube is attached to secure the aeration of said cooling chamber according to the temperature prevailing at the summit of the combustion chamber.

2,108,707
MECHANICAL PROCESS FOR MAKING READY IMPRESSIONS
Friedrich Karl Fleischhack, Leipzig, Germany
No Drawing. Application September 27, 1934, Serial No. 745,801
1 Claim. (Cl. 41—25.5)

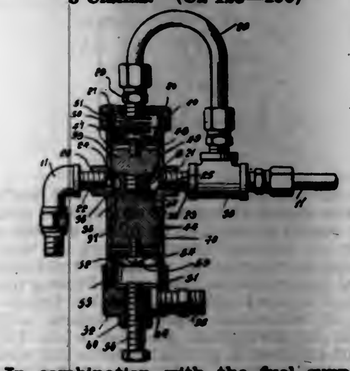
A process of producing "make-readies" for printing comprising first preparing a layer consisting of about 20 parts beeswax, 2 parts petroleum jelly, 15 parts powdered graphite and 5 parts soft soap, then applying said layer to the platen of a printing press, taking impressions of the form on said layer and finally hardening the layer.



2,108,708
ELECTRICAL CONNECTER
Herbert K. Foster, Riverside, N. J.
Application March 20, 1934, Serial No. 716,526
5 Claims. (Cl. 172—332)

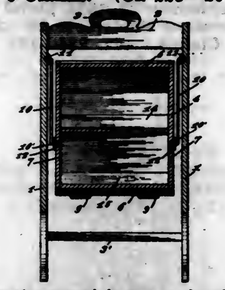
1. In an electric conductor connecter, the combination of an insulated body provided with a pair of paralleling terminal-receiving passageways extending therethrough, each passageway opening into an elongated recess at a face of an end of said body, said face having a centrally disposed recess and a pair of transverse recesses, one communicating between one of said elongated recesses and said centrally disposed recess and the other communicating between the other of said elongated recesses and said centrally disposed recess; a pair of substantially L-shaped resilient terminal contacts in said passageways and elongated recesses, said terminal contacts having means to secure electric conductors thereto with said conductors disposed between the faces of said elongated recesses and said terminal contacts and extending into said transverse recesses and said centrally disposed recess; and means to force said faces of said terminal contacts into contact with conductors disposed in said elongated recesses.

2,108,709
APPARATUS FOR MAKING BOLTS OR THE LIKE
Lee A. Frayer, Kent, Ohio, assignor to The Lamson & Sessions Company, Cleveland, Ohio, a corporation of Ohio
Application September 24, 1935, Serial No. 41,966
18 Claims. (Cl. 10—11)



1. In apparatus of the character described, the combination of a work support including means operable to grip a blank, non-rotatable hollow means shiftable toward the work support and having guide means thereon for cooperation with the blank, a rotary die device in said hollow means and shiftable therewith into position to operate on the blank, means for shifting said hollow means, and means for rotating said die device.

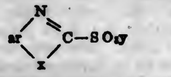
6. In a multiple station machine of the character described having a plurality of spaced work stations, a transfer mechanism adjacent said stations and operable to transfer blanks from one work station to another comprising a bar mounted for movement longitudinally and rotarily of its axis and having means for engaging a blank, and means for imparting rotary and longitudinal movements to said bar to cause engagement of the blank and shifting thereof from one work station to the other.



15. In apparatus of the character described the combination of a pair of cooperating thread rolling dies rotatable about vertically spaced substantially parallel axes and having a blank receiving space therebetween, a rotatable and axially shiftable pointing die spaced laterally from said threading dies and having a blank receiving opening on substantially the same horizontal plane as said blank receiving space, and a transfer mechanism extending laterally adjacent said blank receiving space and opening and operable to transfer blanks from the pointing die to the threading dies.

2,108,710
AUTOMATIC MOTOR FUEL CONTROL
Frederick S. Gleockler, Albert Gleockler, and Frederick M. Gleockler, Camden County, N. J.
Application April 14, 1936, Serial No. 74,364
8 Claims. (Cl. 123—196)

1. In combination with the fuel supply line and pressure-oil circulating line of an internal combustion engine, a casing connected to the fuel supply line, branches leading from the fuel supply line and pressure oil circulating line to the upper and lower ends of the casing respectively, a vertically movable valve body in the casing subject to the pressure of the oil and having a passageway therein between its upper and lower ends to maintain the fuel supply line open, said valve body being also subject to the weight and pressure of the fuel so that in the event of oil-failure, said valve body will lower to cut off the flow of fuel in the fuel supply line, said casing having interiorly thereof spaced apart shoulders, and said valve body having shoulders spaced apart a greater distance than the first mentioned shoulders and engageable therewith.

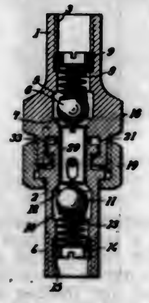


2,108,711
SEWING CABINET
Patrick H. Harmon, San Fernando, Calif.
Application May 23, 1936, Serial No. 81,529
6 Claims. (Cl. 223—107)

1. A cabinet comprising, a pair of spaced apart opposed uprights, a pair of open top trays between said uprights having end and side walls, respectively, and hingedly connected together in end to end position for folding movement into closing and opening relation, and means for suspending said trays from said uprights for relative swinging movement, said means being pivotally connected to said uprights and to the sides of the trays, respectively.

2,108,712
HETEROCYCLIC HYDROXY COMPOUNDS
Ernst Herdieckerhoff, Opladen, near Cologne, and Eduard Tschunkur, Cologne-Mulheim, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application October 5, 1934, Serial No. 747,090. In Germany October 12, 1933
4 Claims. (Cl. 260—44)

1. The process of preparing a compound of the group consisting of 2-hydroxyoxazoles and 2-hydroxythiazoles which comprises splitting off sulfurous acid from a compound of the general formula:

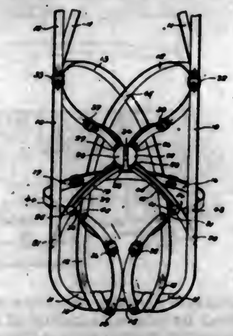


wherein *ar* stands for an arylene radical of the benzene or naphthalene series, *x* stands for a member of the group consisting of sulfur and oxygen, and *y* stands for a member of the group consisting of hydrogen and a monovalent metallic radical, by treating with an acid saponifying agent.

2,108,713
GRID
Ernest C. Hillman, Los Angeles, Calif.
Application May 15, 1936, Serial No. 79,910
3 Claims. (Cl. 52—5)

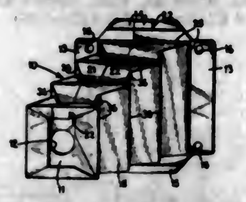
1. A grid of the character disclosed, comprising, in combination with a pan, a series of individual sections forming substantially a continuous surface, and each section having means co-operating with means on other sections for spacing same.

2,108,714
PIPE COUPLING
Peter Hirsch and Rudolf Kaiser, Berlin-Reinickendorf, Germany
Application September 23, 1936, Serial No. 102,023
In Germany September 28, 1935
5 Claims. (Cl. 284—18)



1. A pipe coupling comprising two coupling parts, in each coupling part a valve, means for keeping the valves closed, when the coupling is disconnected, a tubular piece overlapping both ends of the coupling parts and disposed between the two valves for keeping the valves open, when the coupling is connected, and a flange on the tubular piece, adapted to bear against the ends of the coupling parts for securing them against axial displacement.

2,108,715
PROCESS OF COATING WORKED SOLID MATERIALS
Albert Koch, Cologne-Deutz, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application April 9, 1934, Serial No. 719,807. In Germany April 13, 1933
4 Claims. (Cl. 91—68)

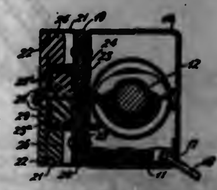


1. The coating of the inner surface of hollows, such as tubes or vessels, with a layer of vulcanized rubber by first applying thereon a vulcanizable rubber mixture, providing the surface thereof with a layer of a strongly adherent water-impermeable film-forming material capable of preventing dissolution and decomposition of ingredients in the interposed rubber coating when being in contact with hot water, and effecting vulcanization of the interposed rubber mixture by contacting the layer of the film-forming material with hot water.

2,108,716
DEVICE OF SUPPORT FOR PARACHUTES
Stig Ove Christian Kuhlemann, Stockholm, Sweden, assignor to Carl H. Lundholm, Aktiebolag, Stockholm, Sweden, a company of Sweden
Application February 20, 1937, Serial No. 126,840
In Sweden April 1, 1936
7 Claims. (Cl. 244—151)

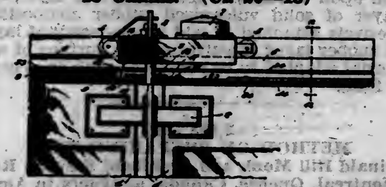
1. In a parachute supporting device, the combination of a body encircling strap having at least one of its ends for placement at the front of the wearer, a pair of leg straps, a separate locking device releasably connecting each of said leg straps to part of the supporting device so as to hold said leg straps in taut lateral position, a fastening device releasably fastening the end of the body encircling strap which is placed at the front of the wearer, said fastening device comprising two interconnectable main parts, and means to unlock said main parts comprising flexible means extending from said main parts to said leg strap locking devices whereby first the leg strap locking devices are released and then the main parts of the device are separated so as to release the end of the body encircling strap and thereby to permit the wearer to free himself from the supporting device.

2,108,717
CAMERA BELLOWS
William L. Lawson, Brooklyn, N. Y.
Application November 26, 1935, Serial No. 51,558
6 Claims. (Cl. 95—39)



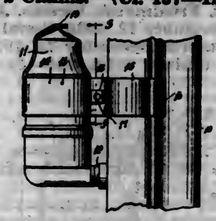
1. A collapsible camera bellows the walls of which are scored alternately on opposite sides to provide panels adapted to be folded against each other in the fully collapsed position, the walls of said bellows comprising a single thickness of material impervious to light rays affecting photographic film, and being sufficiently tough and elastic to withstand repeated flexing without cracking or developing pinholes while having sufficient stiffness to prevent substantial bending of the panels during collapsing of the bellows, said material comprising fibres coated and bound together by an elastic and adhesive binding agent and impregnated with a filler and a stiffening agent.

2,108,718
STATION INDICATOR
John W. Lee, Wilkes-Barre, Pa.
Application May 13, 1937, Serial No. 142,265
2 Claims. (Cl. 40—53)



1. An electrically controlled station indicator comprising a web displaying the names of stations, rollers upon which the ends of the web are wound, brackets supporting the rollers, respective clutches connected to the rollers, a shipper for alternately clutching one clutch and declutching the other clutch, an electric motor geared to said clutches for driving the rollers, a circuit for the motor, a switch in said circuit, a relay controlling said circuit, means for holding the relay circuit closed when said switch is open, a timing roller frictionally engaging the web above one of the web supporting rollers and having yielding cam projections, a circuit in which the coil of said relay is connected, a switch on the last named circuit opened by said cam projection to de-energize the relay and open the motor circuit when the web has advanced each station name into view after said manually operable switch is closed, and a time limit switch in the motor circuit preventing closing of the motor circuit until lapse of a predetermined time period after each actuation.

2,108,719
HAIR WAVING DEVICE
Wilbur S. Lewis, Cleveland, Ohio, assignor to The Murle Co., Cleveland, Ohio, a corporation of Ohio
Application October 31, 1935, Serial No. 47,647
2 Claims. (Cl. 132—36)



2. In a hair waving device of the character described and including a heater formed of two sections each of which is provided with means for supporting a hair clamping member and means for supporting an insulating member, in combination with combined insulating and hair clamping members secured to said device and each comprising integral rubber pads having a clamping portion and an insulating portion, said portions and both of said means having cooperating elements providing an interlock therebetween acting to maintain the combined insulating and hair clamping members in position.

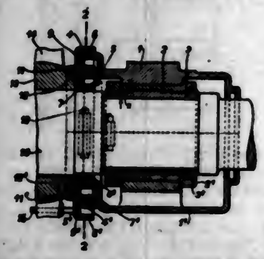
2,108,720
SLOT CLOSER
Leo C. Lake, Evansville, Ind., assignor to International Door Company, Evansville, Ind., a corporation of Illinois
Application January 11, 1937, Serial No. 120,685
18 Claims. (Cl. 20—18)

1. A slot closer for the longitudinally extending slot in the ceiling of a revolving door drum through which the revolving door shaft extends, comprising supports adjacent opposite ends of the slotted portion of the ceiling, a slot closing plate, and means carried by said supports for suspending said slot closing plate for oscillatory movement for opening or closing the slotted portion of the ceiling, said means being engaged and actuated by the shaft of the revolving door.

2,108,721
AIR VENT GUARD
Harvey K. Maxam, Francisco, Ind.
Application November 25, 1936, Serial No. 112,869
2 Claims. (Cl. 137—122)

1. An air vent attachment of the class described comprising a band to embrace an air vent device, jaws extending from the band for attachment to a radiator, means extending from the band and integral therewith for disposition over and relatively close to the vent opening of said device consisting of a finger, to prevent foreign matter entering the vent opening in said air vent device, and means operable to simultaneously bind the jaws to the radiator and the band to the device.

2,108,722
LAMINATED CORROSION RESISTANT STRUCTURE
Hermann Miedel, Frankfort-on-the-Main, Germany, assignor to American Lurgi Corporation, New York, N. Y., a corporation of New York
Application March 1, 1935, Serial No. 8,947
In Germany March 3, 1934
3 Claims. (Cl. 154—43)

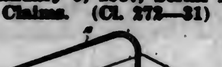


1. A self-supporting constructional material for use as the walls of a conduit, vessel or the like,

for corrosive fluids, formed of a shock-resistant layer consisting essentially of a filler and the solid reaction products of rubber latex with a hydraulic cementitious material and containing at least 25% of rubber derived from the latex and at least 12% of the hydraulic cementitious material based upon the rubber content of the layer, and a layer of solid vulcanized rubber composition adhesively attached to said shock-resistant layer, said rubber layer constituting the surface of said material adapted to be contacted with the corrosive fluid.

2,106,723
METHOD OF PREPARING TiO_2
Reginald Hill Monk and Archibald Stewart Ross, Montreal, Quebec, Canada, assignors to American Zinc, Lead & Smelting Company, St. Louis, Mo., a corporation of Maine
No Drawing. Application November 11, 1935, Serial No. 49,228
18 Claims. (Cl. 23—202)

6. In a process of preparing titanium dioxide, the steps of forming an aqueous and approximately neutral dispersion of a protective colloid and a salt relatively insoluble in water but completely soluble in the aqueous medium resulting from hydrolysis, and then adding a concentrated titanium salt solution thereto.

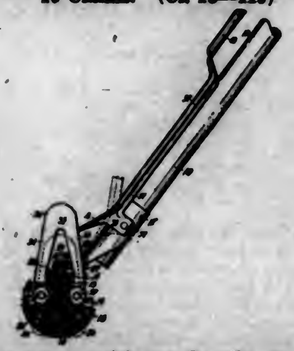


2,106,724
LABYRINTH PACKING FOR BEARINGS
Gustav Nemetz, Vienna, Austria, assignor to the firm Alex. Friedmann, Vienna, Austria
Application December 12, 1936, Serial No. 115,627
In Austria December 21, 1935
4 Claims. (Cl. 286—5)

1. In a bearing a labyrinth packing comprising circular rotating rings and circular stationary rings inserted between and coaxial with said rotating rings, the inner sides of the upper halves, and the outer sides of the lower halves of the stationary rings receding from the circular form so that the width of the stationary rings diminishes from the points situated in the horizontal plane containing the axis of rotation, upwards and downwards.

2,106,725
ASSISTANT FOR THE TREATMENT OF TEXTILES
Alfred Bioche, Wolfen, Kreis Bitterfeld, and Karl Brodersen, Matthias Quaedvlieg, and Hans Maier-Bode, Dessau in Anhalt, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application April 19, 1935, Serial No. 17,236. In Germany April 21, 1934
7 Claims. (Cl. 252—1)

1. The process of treating textiles and other fibrous materials with an aqueous liquor in the presence of a compound containing the chemical grouping



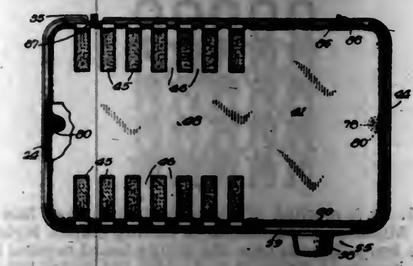
wherein R is an alkyl radicle of at least 10 carbon atoms, x is a member of the group consisting of hydrogen, alkyl and hydroxyalkyl and y is an alkyl radicle with at most 3 carbon atoms containing a salt forming substituent of the group consisting of —OH, —COOH, and —SO_3H.

2,106,726
MECHANICAL TOY
Edward Recuskie, New York, N. Y.
Application January 9, 1937, Serial No. 119,846
7 Claims. (Cl. 272—31)

1. A mechanical toy of the character described, comprising a substantially rectangular box-like structure, a turn-table mounted for rotation on said box, means within said box for rotating said turn-table, a miniature vehicle supported on the surface of said turn-table, and remote control means for guiding said vehicle in a manner to avoid impacting articles held on said turn-table as same is rotated.

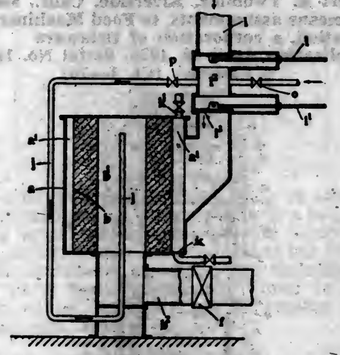
2,106,727
MOP
Kenneth S. Rogers, Niles Township, Berrien County, Mich., assignor to Niles Metalcraft Company, Niles, Mich.
Application October 11, 1935, Serial No. 44,568
10 Claims. (Cl. 15—119)

5. A mop comprising a handle, an inverted channel having downwardly converging sides gripping a portion of a sponge which flares from the channel mouth, means for securing said channel to said handle and a rigid shiftable frame movably mounted on said handle and immovably



journaling spaced rollers positioned on opposite sides of said sponge and adapted to compress said sponge when shifted transversely thereof, said sponge normally pressing said rollers and frame upwardly into the concavities formed by said channel sides and flaring sponge portion.

2,106,728
ARTIFICIAL FISHING BAIT
Willard G. Schilling, Lima, Ohio, assignor to The Weesel Bait Company, Cincinnati, Ohio, a corporation of Ohio
Application March 2, 1936, Serial No. 66,548
9 Claims. (Cl. 43—42)



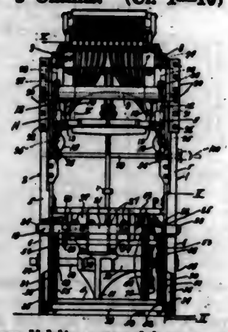
2. A fish lure, comprising, a head element having a plate portion extending forwardly and upwardly therefrom, a hook having its eyelet end secured in the head element and its hook portion extending rearwardly from the head element, said head element incorporating a rearward plate extension, tail feathers having their quill ends secured to the rearward plate extension, and short feathers having their quill ends secured to the head element and distributed around the same, said short feathers providing an annular space permitting water circulation therethrough and free movement of the short feathers for the purpose of similating the movements of a minnow.

2,106,729
RADIO RECEIVER
Adolph J. Snow, Evanston, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application July 6, 1936, Serial No. 89,016
9 Claims. (Cl. 250—14)

6. In combination, a cabinet, a radio set in said cabinet comprising a receiving unit and a sound reproducer, said cabinet having been molded integrally out of plastic material and comprising front, rear, end walls and a top, and a base plate secured to said cabinet and forming a closure therefor, said cabinet being provided with reproduced openings in at least two opposed walls, integral molded grille work extending over said reproducer openings including a series of ribs integrally molded in the two opposed walls of said cabinet and at least partially encircling the top, the receiving unit being mounted in the cabinet in such position that the reproducer is in operative relation to both of said openings so as to emit sound from the openings in a plurality of directions.

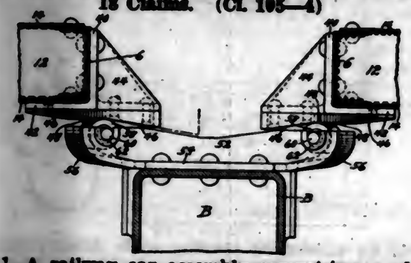
2,106,730
ADSORPTION APPARATUS
Edgar Reuse Sutcliffe, Lowton, Newton-le-Willows, England
Application July 14, 1936, Serial No. 90,616
In Great Britain September 29, 1934
4 Claims. (Cl. 183—4)

1. In an adsorption filter for the adsorption of vapour from vapour laden air, in combination a filter casing, a container for the sorptive medium within the filter casing, an inlet conduit into the filter casing for the air to be filtered in the charging phase and an outlet conduit from the filter casing for the filtered air, two valves in series in said inlet conduit both adapted to be opened in the charging phase, to permit the air to flow through them in series, and closed in the flushing phase, said valves on their closure being spaced apart in the said inlet conduit to form between them a chamber for the reception of inert gas, a valve-controlled inlet conduit into the said chamber for the inert gas and a valve controlled outlet conduit from said chamber into the filter casing in position to cause the inert gas from said chamber to flow through the container, sorptive medium and casing in direction opposite to that in which the air to be filtered passes through the filter casing in the charging phase.



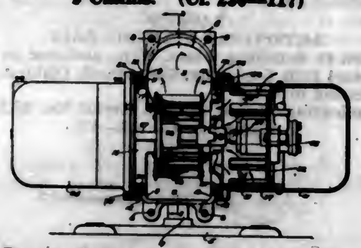
2,106,731
AUTOMATIC GRADING SCALE
Harlan E. Thompson, Alpine, Calif.
Application February 24, 1937, Serial No. 127,493
2 Claims. (Cl. 265—48)

1. An automatic grading scale comprising a base block, a scalebeam pivotally mounted above said base block, means for supporting the article to be weighed connected to one end of said scalebeam, means disclosing the grade of the object being graded comprising a grade chart mounted upon the opposite end of said scalebeam, a cover plate mounted on said base block immediately in front of said grade scale, and said cover plate having a narrow opening formed



therethrough through which passes said scale-beam, and means automatically counterbalancing the various downward forces of various objects as each is being graded.

2,106,732
DRIVE FOR BOX LIDDING MACHINES
Herbert E. Twomley, Riverside, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware
Application April 29, 1935, Serial No. 18,767
3 Claims. (Cl. 1—10)



1. In a box lidding machine, means for supporting a box to be lidded, means disposed above said supporting means for applying lids to boxes, means mounting said box supporting means for elevation toward said lid applying means, a power shaft, one or more chains connected to said power shaft and coupled to said box supporting means, a pulley for each of said chains over which said chains are disposed and means mounting said pulleys above the point of attachment of said chains to said box supporting means whereby rotation of said power shaft in one direction will wind up said chain and lift said box supporting means, and means for supplying power to rotate said shaft including a friction coupling for limiting the lifting force applied to said box supporting means.

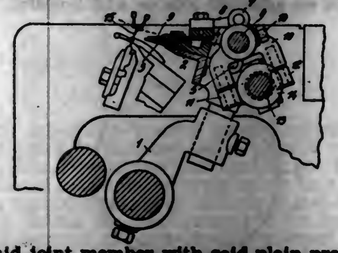
2,106,733
SIDE BEARING FOR ARTICULATED CARS
Sigvald F. Udstad, Berwick, Pa., assignor to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey
Application December 30, 1936, Serial No. 118,197
18 Claims. (Cl. 105—4)

1. A railway car assembly comprising a plurality of bodies, a truck supporting the adjacent end portions of two of said bodies, body side bearings secured to said end portions and extending outwardly therefrom, and side bearings on said truck engageable by said body side bearings, said body side bearings being provided with inclined bearing surfaces directed downwardly toward the transverse center line of said truck.

2,106,734
OIL BURNER
Josiah Howard Van Scivr, Elkins Park, Pa., assignor to Bethlehem Foundry & Machine Company, Bethlehem, Pa., a corporation of Pennsylvania
Application January 8, 1937, Serial No. 119,685
9 Claims. (Cl. 230—117)

1. In an oil burner, the combination with a casing providing a blower chamber and a discharge conduit extending from one side of said chamber, said casing having an opening in each of two adjoining sides of the chamber and respectively at opposite sides of said conduit, a resilient element seated in each of said openings, and a member supported in said resilient elements and constituting a common support for a motor, a pump and a blower operatively connected in line extending transversely to the axis of the discharge conduit, said blower being located within said chamber.

2,106,735
METHOD OF MANUFACTURING MILANESE WARP FABRIC
Herbert Wirth, Hartmannsdorf, near Chemnitz, Germany, assignor to the firma Emil Wirth Wirkmaschinenfabrik, Hartmannsdorf, near Chemnitz, Germany
Application February 21, 1936, Serial No. 65,150
In Germany February 22, 1935
6 Claims. (Cl. 66—86)



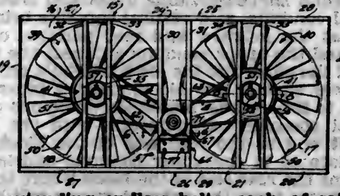
1. In a method of manufacturing warp fabric on Milanese warp machines having guides, laying the warp threads over the spring beard needles in the rearward direction and under the spring beard needles in the forward direction and compensating the rearward movement by a corresponding forward movement of the warp threads under the spring beard needles.

2,106,736
PRESSER ARRANGEMENT FOR WARP KNITTING MACHINES
Herbert Wirth, Hartmannsdorf, near Chemnitz, Germany, assignor to the firma Emil Wirth Wirkmaschinenfabrik, Hartmannsdorf, near Chemnitz, Germany
Application February 13, 1937, Serial No. 125,658
In Germany February 22, 1936
4 Claims. (Cl. 66—86)

1. An alternately acting presser device for warp knitting machines, comprising a plain presser, a

holder carrying said plain presser, a pattern presser also carried by said holder, a shiftable shaft journalled in said holder, a double cone fixed upon said shiftable shaft, a second shaft rotatably mounted in said holder, a joint member fixed to said rotatable shaft, a link connect-

ing said joint member with said plain presser, a second link connecting said joint member with said pattern presser, a fork fixed to said rotatable shaft, and a roller provided at each prong of said fork, said rollers being adapted to cooperate with said double cone.

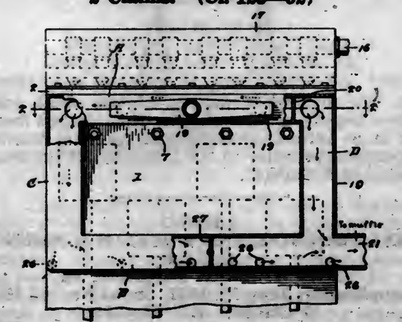


2,106,737
FABRIC TAKE-UP DEVICE FOR FLAT WARP KNITTING MACHINES
Emil Herbert Wirth, Hartmannsdorf, near Chemnitz, Germany, assignor to the firma Emil Wirth Wirkmaschinenfabrik, Hartmannsdorf, near Chemnitz, Germany
Application July 29, 1937, Serial No. 156,469
In Germany August 4, 1936
4 Claims. (Cl. 66—149)

1. In a fabric take-up device for flat warp knitting machines of the kind set forth, a chain driving the fabric take-up device and carrying a freely suspended roller, a bearing member fixed to the machine frame, a spindle journalled in said bearing member, means for rotating said spindle by the ratchet mechanism influencing the fabric take-up device, and means for resiliently connecting said spindle to said freely suspended roller.

2,106,738
TWIN-FAN STRUCTURE
William W. Allen, Jacksonville, Fla.
Application March 12, 1937, Serial No. 130,563
7 Claims. (Cl. 230—278)

1. A twin-fan structure including a pair of parallel vertical fan elements arranged in sidewise disposed relation and in close proximity to each other, a stationary shaft for revolubly supporting each fan element, said shafts having their axes disposed in parallel spaced relation, a motor, a power transmitting means driven from said motor and connected to said elements for simultaneously operating them, said power transmitting means being in the form of a pair of oppo-



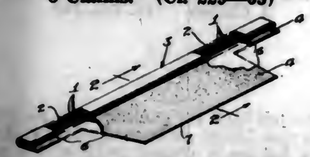
sitely extending endless belts, each of said fan elements including a hub engaged by a belt, supporting structure common to said motor and shafts, said fan elements arranged in the front of said structure, and said structure including coacting parts for adjusting said motor in paths at right angles for controlling the tension of the belts on said hubs.

2,106,739
THUMB TACK
Arnold G. O. Andersen, Cocoab, Conn.
Application November 16, 1936, Serial No. 111,135
2 Claims. (Cl. 85—16)

1. A thumb tack for pulling with an extractor in which the latter is turned to pry the tack, said tack having a domed head and a slot adjacent its periphery, the slot being of progressively reduced width and having arcuate side edges of which the outer has its center at the center of the head and the inner its center eccentric to the head center, so that an extractor with a lateral lug may be inserted through the wider end of the slot and moved in the direction of the length of the slot to have the lug engage the underface of the head and lift the tack.

2,106,740
ENGINE
Uriah Belford, Golconda, Ill., assignor of one-half to Cody Lightner
Application January 25, 1937, Serial No. 122,288
2 Claims. (Cl. 123—52)

1. In an internal combustion engine cylinder block having cylinders provided with intake and



exhaust means opening outwardly through opposite sides of the block, intake and exhaust manifolds located on opposite sides of the block and communicating with the intake and exhaust means, said intake and exhaust manifolds on each side of the block being integrally connected, and each exhaust manifold being of substantially rectangular shape providing upper and lower and vertical conduits, said vertical conduits being located at the forward and rear portions of the block and the upper conduits adjacent the upper edge of the block and the lower conduits adjacent the lower edge of the block, exhaust pipes connected to the exhaust manifolds where one of the vertical conduits communicates with the lower conduit and at the rear end of the block, and gates located in the upper conduits and located adjacent the rear end of the block where the exhaust gases from the exhaust means will be divided and the major portion of the exhaust gases caused to travel forwardly through the upper conduits and downwardly through the forward vertical conduits and through the lower conduits while a less amount of exhaust gases will be directed through the vertical conduits at the rear end of the block to the lower conduits.

2,108,741

BAG CLOSURE

Benjamin C. Betner, Ithan, Pa.

Application November 9, 1936, Serial No. 110,004
8 Claims. (Cl. 229—65)

1. An article of the character described comprising a narrow elongated tie element composed of a plurality of strands of wire arranged in closely spaced parallel relation, a tubular covering snugly embracing said tie element throughout its length, and means securing said covering and the tie element together.

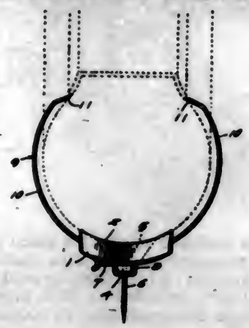
2,108,742

BRUSH

Frederic J. Bickel, Cleveland, Ohio, assignor to The Osborn Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

Application July 13, 1936, Serial No. 90,368
6 Claims. (Cl. 300—21)

1. The method of making a brush which comprises looping bristles about a ring shaped member in an annular channel, and applying internal expanding pressure to the free edge of the inner wall of said channel.



2,108,743

AXLE HOUSING AND WHEEL ALIGNMENT GAUGE

Myrl W. Brady, Tarentum, Pa.

Application June 22, 1937, Serial No. 149,765
5 Claims. (Cl. 33—203)

1. A gauge device of the character described, comprising a body adapted to be disposed against the tread surface of a motor vehicle wheel, means carried by the body for detachably securing the same to said surface, and pointer means carried by the body facilitating the laying off upon an underlying surface of indicia necessary for determining the relation of the motor vehicle wheel to an adjacent axle or axle housing.

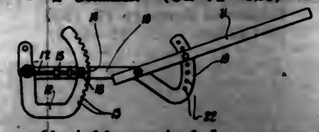
4. The method of determining the straightness of the rear axle housing of a motor vehicle, which comprises raising the rear wheels of the vehicle sufficiently to permit free rotation of said wheels, fixing a pointer on each wheel at the peripheral center, rotating both wheels in one and the same direction to bring said pointers in contact with the underlying surface, marking the points of engagement of the pointers with the surface, reversely rotating both wheels to bring the pointers in contact with the surface at the opposite sides of the wheels, marking the surface where each wheel carried pointer contacts, and then measuring the distances transversely of the vehicle between the points marked at the fronts of the wheels and the points marked at the backs of the wheels to determine whether or not such distances are equal.

2,108,744

DIAPHRAGM TYPE EVAPORATOR

Lewis M. Crosley and Roland H. Money, Cincinnati, Ohio, assignors to The Crosley Radio Corporation, Cincinnati, Ohio, a corporation of Ohio

Application August 27, 1934, Serial No. 741,541
11 Claims. (Cl. 62—126)



1. A refrigerator evaporator comprising a sheet metal member of substantial U-shape embossed to form a header and a plurality of passageways extending therefrom, a second sheet metal member of substantial U-shape acting as a diaphragm, and a third sheet metal member of substantial U-shape, and embossed to form an exit header and a plurality of passageways, said members being assembled one inside the other and joined to provide a closed system, said diaphragm member being perforated to provide access from one group of passageways to another at a point remote from said headers, and serving to complete said headers and passageways.

2,108,745

ADJUSTABLE CONTROL LEVER

Victor John Dodd, Kalamunda, West Australia, Australia

Application October 15, 1936, Serial No. 105,814
2 Claims. (Cl. 74—525)

1. An adjustable control lever comprising a slotted plate, a member being pivoted to and having a face resiliently held against one face of said slotted plate, means mounted on said member for normally engaging the slots of said slotted plate, a slotted quadrant formed at the free end of said member, an extension lever being pivotally connected to said member and located on the aforesaid face and resiliently held against said quadrant, and means mounted on said extension lever for normally engaging the slots of said quadrant.

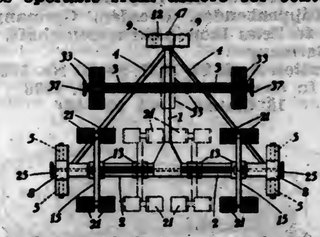
2,108,746

SAFETY DEVICE FOR MACHINE PARTS SUBJECT TO HIGH PRESSURES

Abraham Martinius Erichsen, Teltow, near Berlin, Germany

Application January 27, 1937, Serial No. 122,532
In Germany March 24, 1934
9 Claims. (Cl. 80—57)

1. A safety device to be interposed between parts of a rolling mill, press or other like machine liable to be subjected to heavy pressure and adapted to relieve the pressure when a determined maximum pressure is reached, comprising a pressure chamber having an escape orifice, a pressure medium in said chamber, a plunger in said chamber for compressing said medium under the pressure applied to the aforesaid parts of the machine to be controlled, a safety element normally closing said escape orifice, said safety element being subjected to the action of the pressure medium and adapted to open said orifice when the determined maximum pressure is reached, the said pressure medium being a non-fluid homogeneous whole which is capable of flowing at a pressure at least as low as said maximum pressure.



2,108,747

LAUNCHING AND BEACHING OF AIRCRAFT

William Gordon Glover, London, England

Application May 29, 1936, Serial No. 82,592
In Great Britain May 31, 1935
5 Claims. (Cl. 280—1)

2. Improvement in apparatus for handling aircraft of the seaplane and amphibian types when launching and beaching an aircraft via a slipway, comprising a mobile submersible cradle, a plurality of abutment members adjustably mounted on said cradle and articulated so as to be free to oscillate longitudinally and laterally to conform to the contours of an aircraft with substantially uniform contact pressure throughout, means to adjust the positions of said articulated abutment members, and means mounted on said cradles operable from ashore for centering an

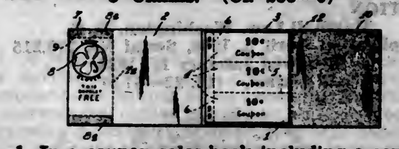
aircraft above said abutment members when said cradle is in the water.

2,108,748

STORAGE BATTERY POSITIVE ELECTRODE AND METHOD OF MAKING THE SAME

Harold R. Harner, Frederick H. Schultz, and Everett J. Ritchie, Joplin, Mo., assignors to The Eagle-Picher Lead Company, Cincinnati, Ohio, a corporation of Ohio

No Drawing. Application September 30, 1935
Serial No. 42,878
10 Claims. (Cl. 136—26)



7. A lead-acid storage battery electrode characterized by the presence of a bonding network produced in situ by treating the electrode with liquid solutions of phenol-formaldehyde and sulphuric acid.

2,108,749

COUPON BOOK

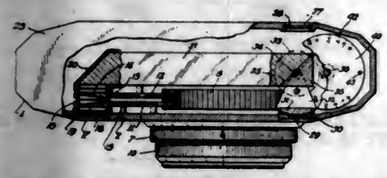
Billups Harris, Columbus, Miss.

Application October 31, 1936, Serial No. 108,669
5 Claims. (Cl. 283—6)

1. In a coupon sales book including a series of coupons and a cover therefor, a flap, having a symbol on its inner face, formed on an outer edge of said cover; means for fastening said flap throughout its upper and lower margins to a face of said cover with the symbol concealed; and means inwardly of said fastened margins of said flap weakening said flap along lines parallel to said margins whereby said flap may be severed along said weakened lines to expose the concealed symbol.

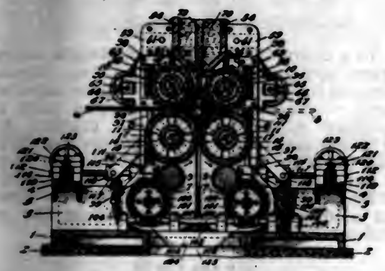
2,108,750

HIGHWAY CONSTRUCTION



John Warren Isett, Hinsdale, Ill.

Application January 27, 1937, Serial No. 122,497
12 Claims. (Cl. 94—4)

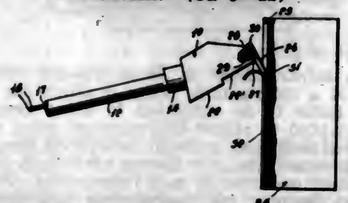


1. That improvement in the art of highway construction which comprises, in combination, a road bed, a plurality of forms extending longitudinally of said bed, anchoring means extending between the forms and the road bed for securing the former rigidly to the latter, and a crown or cap of solid material extending between said forms, superimposed upon the surface of said highway.

2,106,751
PHOTOGRAPHIC DEVICE
Heinz Küppenbender, Dresden, Germany, assignor to Zeiss Ikon Aktiengesellschaft, Dresden, Germany
Application April 23, 1937, Serial No. 138,563
In Germany February 22, 1936
13 Claims. (Cl. 95—44)

13. In a range finder for photographic cameras, means to produce at two spaced points images of an object to be photographed, means for combining said images, manually actuated means adjacent one of said points for deflecting the image there so as to bring the two images in superposition, means for viewing said images, a second manually actuated means at the other of said points for deflecting the image there for bringing two images of another object in the same picture field that is spaced a different distance from the instrument than the first object, into superposition, and means for indicating the amount of adjustment of each of said manually actuated means.

2,106,752
METHOD OF AND APPARATUS FOR SHAPING METAL DELIVERED IN A MOLTEN CONDITION
Marshall Low, Washington, D. C.
Application April 5, 1934, Serial No. 719,215
Renewed January 17, 1938
35 Claims. (Cl. 22—57.5)



3. Apparatus of the character described comprising an assembly of more than two rolls arranged to define a substantially closed chamber for receiving a supply of molten metal, a restricted throat through which molten metal is adapted to be introduced into said chamber, and a sheet forming pass communicating with said chamber; means for cooling said rolls to extract heat from the metal in said chamber, said rolls presenting cooling surfaces of substantially equal areas to the heated metal in said chamber, thus rendering the metal in contact therewith relatively plastic in zones of equal areas on opposite sides of said pass; and means for rotating said rolls to move the plastic metal of said zones outwardly through said pass to be united by the pressure of said rolls, thus forming a sheet cooled on opposite sides substantially equal depths.

2,106,753
METHOD OF AND APPARATUS FOR SHAPING METAL DELIVERED IN A MOLTEN CONDITION
Marshall Low, Washington, D. C.
Application July 9, 1934, Serial No. 734,350
Renewed January 17, 1938
25 Claims. (Cl. 22—57.5)

1. The method of rolling sheets or bars from material delivered in a molten condition which comprises the steps of passing the molten material through a series of chambers defined by a plurality of pairs of rolls arranged in side by side relation; rendering the material relatively plastic by progressively reducing the temperature of the material during its passage through said chambers in accordance with a predetermined temperature gradient; rolling the plastic material into sheet or bar form while it is still hot from its original heat; and automatically controlling the speed of rotation of said rolls by and in accordance with the temperature and characteristics of the material.

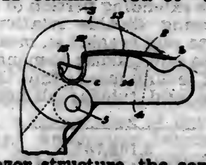
2,106,754
FOUNDATION FASTENER AND DECAPPING TOOL
Ray Ludke, Coplay, Pa.
Application March 11, 1937, Serial No. 130,386
2 Claims. (Cl. 6—12)

1. A honeycomb tool, comprising a head portion, a handle and a stem adapted to be secured to one end of said head, said head adapted to be heated by means mounted in the stem, the face of said head portion having a shoulder facing toward the free end of the head to facilitate the positioning of said tool against a frame, and said tool being adapted to secure a foundation to the frame.

2,106,755
PROCESS FOR PURIFICATION OF SULPHONATION PRODUCTS
Walter H. McAllister, Wyoming, Ohio, assignor, by direct and mesne assignments, of one-half to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio, and of one-half to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application February 21, 1935, Serial No. 7,582
16 Claims. (Cl. 260—99.12)

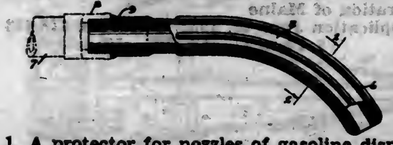
1. The process for the purification of products reacted with sulphonating agents which comprises mixing with water a sulphonated product of the group consisting of a neutralized reaction product of a sulphonating agent on a primary aliphatic alcohol having ten to twenty-two carbon atoms per molecule, a neutralized reaction product of a sulphonating agent on a secondary aliphatic alcohol having ten to twenty-five carbon atoms per molecule, and a neutralized reaction product of a sulphonating agent on a product consisting predominantly of olefins having ten to twenty-five carbon atoms per molecule, incorporating the aqueous mixture thus formed and containing a salt of the sulphonated compound in solution with sufficient water-soluble monohydric aliphatic alcohol containing one to three carbon atoms to avoid the formation of troublesome emulsions in subsequent treatment, and subjecting the resulting mixture to extraction with liquid hydrocarbons having a boiling point below 200° C., thereby freeing the water-soluble salt from matter not reacted with and not capable of reacting with said sulphonating agents, and obtaining a laundering agent.

2,106,756
DETERGENTS FOR USE IN LAUNDERING PROCESSES
Walter H. McAllister, Wyoming, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
No Drawing. Application April 17, 1935, Serial No. 16,815
13 Claims. (Cl. 260—99.12)



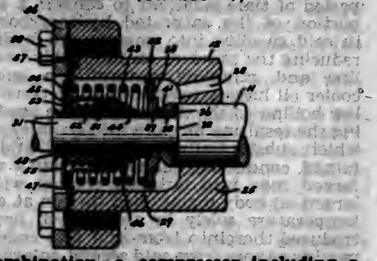
1. A process of preparing a detergent suitable for laundering processes comprising extracting organic unsulfated material and other organic impurities from a product containing water-soluble salts of alkyl sulfuric acids obtained from secondary alcohols having ten to twenty-five carbon atoms in the molecule.

2,106,757
GARMENT HANGER
John F. Harrison, Marion, Ohio
Application October 13, 1937, Serial No. 168,714
5 Claims. (Cl. 223—93)



1. As an element of a garment-supporting or display device, a substantially flat frame, said frame having a front face and a rear face, resilient means extending along opposite side margins of said frame to secure folds of the garment material gathered along such side margins, one of said means extending across and being secured to said frame upon its front face and another of said means extending across and being secured to said rear face.

2,106,758
SAFETY RAZOR
Ralph E. Thompson, Brookline, and Charles J. Emerson, Winchester, Mass., and Bennett G. Jansson, Kittery Point, Maine, assignors to Emerson Apparatus Company, Melrose, Mass., a corporation of Rhode Island
Application October 23, 1935, Serial No. 46,294
11 Claims. (Cl. 30—51)



1. In a razor structure, the combination of a holder including parts relatively movable to clamp a blade between them in position for shaving, said parts being shaped to receive a hollow rib formed in said blade, and means for relatively moving said parts to squeeze said rib transversely so as to reduce the over-all width of the rib.

2,106,759
ANTISTATIC GASOLINE DISPENSING NOZZLE
Gardner W. Turman, Denver, Colo., assignor to The Gates Rubber Company, Denver, Colo., a corporation of Colorado
Application January 25, 1937, Serial No. 122,142
5 Claims. (Cl. 221—84)

1. A protector for nozzles of gasoline dispensing devices formed of a synthetic rubber-like compound containing as an essential constituent a polymerized olefin polysulfide, said protector possessing a limited degree of electrical conductivity sufficient to gradually dissipate static electricity tending to accumulate thereon.

2,106,760
SEAL FOR REFRIGERATING APPARATUS
George F. Weiher, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application November 25, 1936, Serial No. 112,762
2 Claims. (Cl. 286—7)

1. In combination, a compressor including a crankcase having an opening in a wall thereof, a rotary shaft extending through the opening, means forming a shoulder on the shaft, a member surrounding the extending portion of the shaft and having a sealing surface adapted to

engage the shoulder forming means on the shaft, means for urging the sealing surface on said member against the shoulder forming means on the shaft, means interposed between said member and said compressor crankcase for sealing the shaft gas tight at the opening in the crankcase, said last named means comprising a rigid tubular element having an end thereof secured to said member and extending outwardly therefrom, a rigid collar surrounding the extending portion of said tubular element and being slidable relative thereto, a plate clamped to said crankcase, means for sealing said collar to said tubular element, and means for urging said sealing means into tight engagement with the said tubular element and said collar.

2,168,761

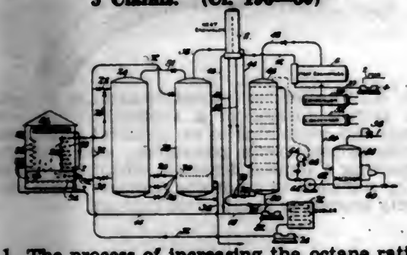
FIRE RESISTANT PULP BOARD

Hubert L. Becher, Trenton, N. J., assignor to Monsanto Company, a corporation of New Jersey

No Drawing. Application March 28, 1936, Serial No. 71,535

12 Claims. (Cl. 92—21)

1. A highly fire resistant substantially hard surface board comprising cellulosic fibres coated with aluminum hydrate and mixed with a substantial proportion of fuller's earth and exfoliated vermiculite.



2,168,762

PROCESS FOR CRACKING GASOLINE

David G. Brandt, Westfield, N. J., assignor to Power Patents Company, Hillside, N. J., a corporation of Maine

Application June 22, 1932, Serial No. 618,623

5 Claims. (Cl. 196—50)

1. The process of increasing the octane rating of knock producing gasolines, which comprises preheating the gasoline to a temperature of about 550° F. under a pressure of about 1000 pounds per square inch, further heating the preheated gasoline while under said pressure to a temperature of from 925° to 1100° F. for a substantial period of time sufficient to convert a substantial portion of the saturated hydrocarbons present in said gasoline into unsaturated hydrocarbons, reducing the pressure on the highly heated gasoline and mingling therewith a substantially cooler oil having substantially no constituents as low boiling as the desired gasoline product, passing the resulting mixture into an enlarged zone in which substantially no body of liquid is maintained, conducting the mixture into a second enlarged zone into intimate contact with an enlarged oil body maintained therein at a cracking temperature solely by the hot oil products introduced thereinto from said first enlarged zone, passing vapors from said second enlarged zone in indirect heat exchange with said gasoline to effect said preheating, and further fractionating said vapors to separate a gasoline of relatively high octane rating compared to the initial gasoline stock.

2,168,763

PROCESS FOR CLEANING FRUITS AND VEGETABLES

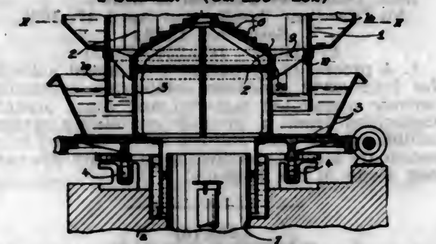
Thomas S. Carswell, Kirkwood, Mo., assignor, by mesne assignments, to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application February 17, 1934, Serial No. 711,819

18 Claims. (Cl. 99—103)

1. A process for the removal of spray residues from fruit and vegetables comprising the application thereto of a dilute aqueous solution of an inorganic acid containing a small proportion of an alkali metal salt of a compound obtainable by reacting sulfuric acid with the reaction product of an aliphatic alcohol and a diphenyl compound.

2,168,764



GAS PRODUCER

Hans Deringer, Winterthur, Switzerland, assignor, by mesne assignments, to Koppers Company, Pittsburgh, Pa., a corporation of Delaware

Application March 2, 1937, Serial No. 128,575

In Switzerland August 29, 1935

4 Claims. (Cl. 126—132)

1. A gas producer comprising a shell, a rotary grate and a rotary ash extractor tray annularly surrounding the grate disposed at the bottom of said shell, said tray projecting under the shell in vertically spaced relation therewith and said grate comprising a lower tubular conduit and an upper conical gas diffusion grid therefor arranged within the bottom of the shell in spaced relation therewith so as to leave an annular crushing space between the periphery of the tubular conduit and the shell for crushing of ash during descent therethrough to said tray, and a plurality of radially extending ash agitating members in an annular series mounted for rotation in the space between the periphery of the tubular conduit and the shell, said radially extending ash agitating members being annularly spaced from each other and extending from the periphery of the tubular conduit to near the shell wall.

2,168,765

PRESERVING AND DISINFECTING MEDIA

Gerhard Domagk, Wuppertal-Elberfeld, Germany, assignor, by mesne assignments, to Alba Pharmaceutical Company, Inc., New York, N. Y., a corporation of New York

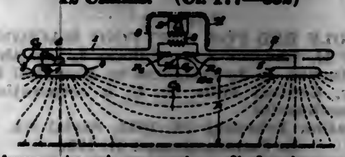
No Drawing. Application April 7, 1934, Serial No. 719,592. In Switzerland April 13, 1933

14 Claims. (Cl. 167—30)

1. A preserving and disinfecting medium comprising as an active preserving and disinfecting ingredient a non-acylated quaternary ammonium compound at least once substituted by a higher molecular aliphatic radical selected from the group consisting of higher alkyl, hydroxyalkyl, halogenalkyl, alkoxyalkyl, alkylmercaptoalkyl, aminoalkyl and alkylaminoalkyl radicals.

14. A preserving and disinfecting medium comprising as an active preserving and disinfecting ingredient a quaternary ammonium halide substituted by two lower alkyl groups, one benzyl group, and a higher molecular alkyl radical of 8 to 18 carbon atoms.

2,168,766



DISTANCE MEASURING MEANS AND METHOD

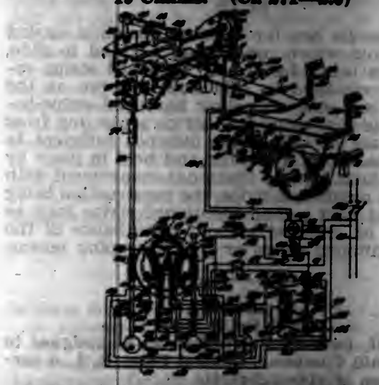
Fritz Fischer, Berlin-Charlottenburg, and Ludwig Kellstab, Berlin-Nikolassee, Germany, assignors to Siemens & Halske, Aktiengesellschaft, Siemensstadt, near Berlin, a corporation of Germany

Application March 31, 1933, Serial No. 663,764

In Germany April 2, 1932

12 Claims. (Cl. 177—353)

6. Apparatus in an aircraft having metallic parts, for determining the distance of said craft from the ground or other objects, comprising two conducting bodies arranged on said craft in such relation as to form a condenser the capacity of which is adapted to be affected by the ground or other object the distance of which from the craft is to be determined, whenever there is a change in such distance, means for determining the capacity of said condenser, and means for substantially reducing the influence which is exerted on the measurement by the capacity existing between the said conducting bodies and the metallic parts of the craft.



2,168,767

PAPER REGISTERING SYSTEM

Alan S. Fitz Gerald, Wynnewood, Pa., assignor of one-half to Frank H. Fleer Corporation, Philadelphia, Pa., a corporation of Delaware

Application February 27, 1936, Serial No. 66,023

19 Claims. (Cl. 271—3.6)

1. A material feed control comprising the combination of a device for feeding a web of material past a predetermined point, said web having indicia in spaced relation thereon, a mechanism for increasing and decreasing the rate of web feed, means responsive to a change of phase relation of said indicia to said point to actuate said mechanism to both increase and decrease the rate of web feed according to said change of phase relation, and means associated with said responsive means to prevent the amplitude of rate change on said web from increasing cumulatively, whereby substantially constant phase relation between said indicia and said point is maintained.

2,168,768

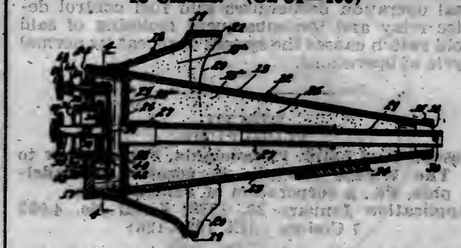
COATING COMPOSITIONS

Ernst Helft, Berlin-Halensee, Germany, assignor to American Hyalsel Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 1, 1933, Serial No. 654,771. In Germany February 3, 1932

3 Claims. (Cl. 134—79)

1. A liquid coating composition comprising, in combination, nitro-cellulose, ethyl acetate, pulverulent material and a small proportion of dodecyl alcohol.



2,168,769

MUSICAL INSTRUMENT

Guy B. Humes, Chicago, Ill., assignor, by mesne assignments, of one-half to Willie Berg, Chicago, Ill.

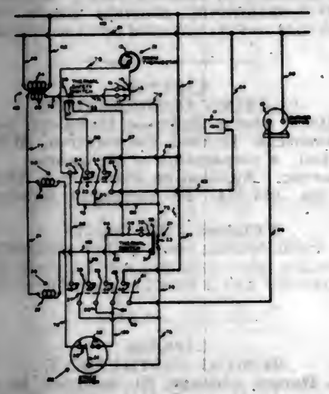
Application November 11, 1936, Serial No. 110,292

13 Claims. (Cl. 84—409)

1. A device of the character described comprising a cone adapted to be inserted in the bell of a musical instrument, a chamber in said cone having an opening adapted to register with said bell, and a bell on said cone adapted to form a sound chamber with the bell of said instrument, and means on the inner walls of said chamber adapted to mute sound emanating from said chambers.

2,168,770

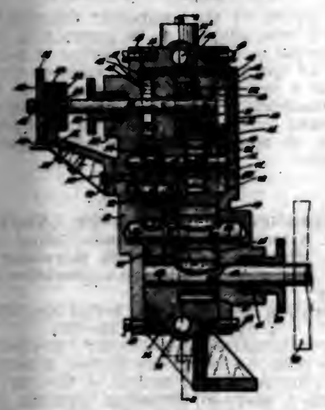
PREIGNITION OIL BURNER SYSTEM



John P. Kriechbaum, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

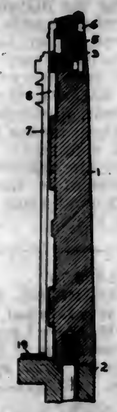
Application May 21, 1934, Serial No. 726,764

3 Claims. (Cl. 158—28)



1. In combination, a fuel control device, a first relay in control thereof, an igniter, a second relay in control of said igniter, a thermal timer including a thermal actuating element and an associated electrical heater, a timer switch closed by the timer thermal actuating element when heated to a predetermined degree by its associated heater, hot and cold combustion responsive switches arranged to close the cold switch a delayed interval after opening of said hot switch upon combustion failure, said hot switch being closed before opening of said cold switch upon establishment of combustion, a main switch, circuit connections for energizing the actuator of said

igniter relay and the heater of said thermal timer controlled by said main switch and cold switch, circuit connections for energizing the actuator of said fuel control device relay controlled by said timer switch and said main switch, and a maintaining circuit for the actuator of said fuel con-

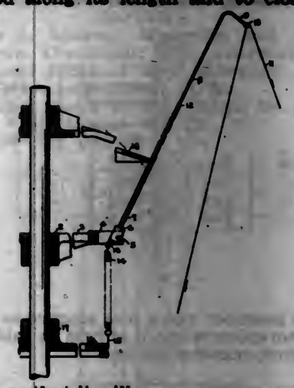


trol device relay controlled by said main switch and said hot switch, whereby opening of said hot switch as a result of a failure of flame during normal operation deenergizes said fuel control device relay and the subsequent reclosing of said cold switch causes the system to repeat its normal cycle of operations.

2,108,771
FLUID PUMP
Joseph Paul Laird, Philadelphia, Pa., assignor to The Wicaco Machine Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application January 30, 1935, Serial No. 4,003
7 Claims. (Cl. 103—126)

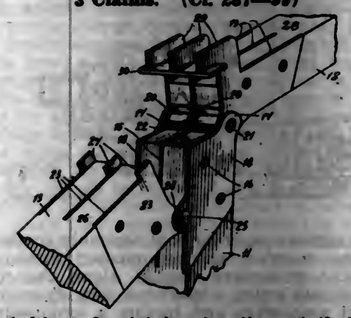
1. A gear pump comprising front and back pump plates, a body between the plates, means for connecting the plates against the body protecting against leakage, a driving shaft, bearings therefor, a driving primary pump gear on the driving shaft, a primary pump driven shaft, bearings therefor, a driven pump gear upon said driven shaft and meshing with the driving pump gear, a driving transmission gear driven from said driven shaft, a driven transmission gear driven from the driving transmission gear, a shaft and bearings therefor, a driving secondary pump gear mounted upon the driven transmission shaft, a driven secondary pump gear adapted to mesh with and be adjusted axially with respect to the driving secondary pump gear, walls forming a cylinder fitting the driven secondary pump gear, pistons at opposite ends of the driven secondary pump gear, movable in the cylinder, one of them having an arcuate opening to accommodate the driving secondary pump gear, a filler for the arcuate opening, means for shifting the pistons and driven secondary pump gear longitudinally, walls forming an inlet to the primary pump, an outlet from the secondary pump and a series connection between the pumps, and the transmission gearing between the pumps being proportioned to operate the secondary pump at a higher speed than the primary pump.

2,108,772
NEEDLE BED FOR KNITTING MACHINES
Robert H. Lawson and William L. Smith, Jr., Pawtucket, R. I., assignors to Hemphill Company, Central Falls, R. I., a corporation of Massachusetts
Application February 20, 1935, Serial No. 7,424
In Canada August 21, 1934
6 Claims. (Cl. 66—115)



1. A needle bed for knitting machines having slots within which needles are adapted to slide, said slots being formed of hardened strips removably clamped in said bed to serve as the walls of said slot, and other hardened strips between said first mentioned strips projecting from the surface of said bed a distance sufficient to form a backing for needles and held in place by a positioning lug and frictional engagement with said first mentioned strips, the construction being such that said second mentioned strips may be inserted or removed without disturbance of the first mentioned strips or their clamping means.

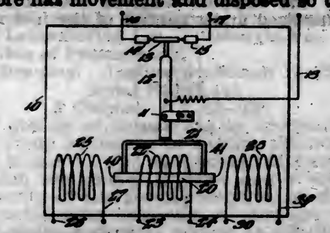
2,108,773
TAKE-UP ROD
Robert H. Lawson, Pawtucket, R. I., assignor to Hemphill Company, Central Falls, R. I., a corporation of Massachusetts
Application April 28, 1936, Serial No. 76,777
7 Claims. (Cl. 66—146)



1. A take-up rod for machines of the type described comprising a yarn tensioning arm resiliently urged in one direction and means at-

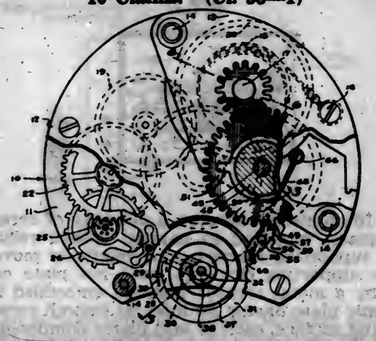
tached to said arm for allowing the same to be displaced along its length and to elongate the

said rod so that it will assume an accessible position for the purpose of threading.



2,108,774
HINGE
Sidney Lipert, Edmonton, England
Application December 28, 1936, Serial No. 117,833
In Great Britain March 21, 1936
3 Claims. (Cl. 287—99)

3. A hinge for joining together at their ends three bars, two of which are pivoted on the third and are adapted to be collapsed to lie adjacent and parallel with the third along opposite edges thereof, and are adapted to be erected, one by a movement through two right angles into alignment with the third bar, and the second by a movement through one right angle into perpendicularity with the third bar, comprising in combination, side plates and reinforcing plates fixed in parallel in the ends of the bars and having projecting ears, and hinge pins passing through co-operating ears on the plates of the first and third bars, and of the second and third.

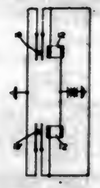


2,108,775
RELAY
William D. Macgeorge, Woodbury, N. J., assignor to Automatic Temperature Control Company, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application October 8, 1935, Serial No. 44,014
10 Claims. (Cl. 175—320)

1. A differential relay comprising a deviating coil having an axis, an armature core, means mounting the armature core for guided movement, the core disposed adjacent to said coil substantially concentric with the axis thereof, a polarizing and centering coil relative to which the core has movement and disposed so that the

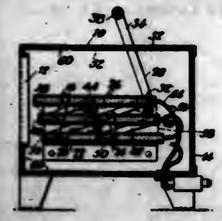
core is in its field, and the core and centering coil acting together as a solenoid, circuit controlling means operatively associated with the armature core.

2,108,776
STARTING MECHANISM
Andrew G. McNicoll, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application August 28, 1936, Serial No. 98,288
10 Claims. (Cl. 58—1)



1. A device of the character described, comprising, in combination, a clock mechanism including a balance wheel, a winding stem, means to rotate said winding stem, and means to impart the motion initially imparted to said winding stem to said balance wheel to agitate the same and start said clock mechanism, said last mentioned means comprising a gear affixed to said winding stem, and resilient means adjacent said balance wheel actuated by said gear and adapted to brush against said balance wheel upon motion of said winding stem.

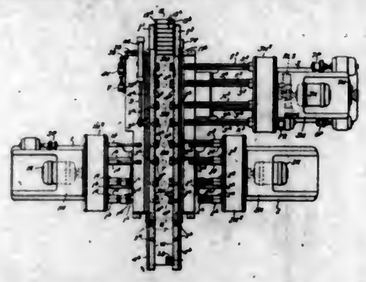
2,108,777
ROTARY SWITCH
Harold P. Mixer, Frankfort, N. Y., assignor to Remington Rand Inc., Buffalo, N. Y., a corporation of Delaware
Application December 7, 1935, Serial No. 53,285
4 Claims. (Cl. 175—375)



1. The combination of a pair of step by step switches, each provided with a plurality of wipers and a stepping magnet therefor, means responsive to the energization and deenergization of each of the stepping magnets for stepping the wipers, and interrupter contacts interacting with each of the stepping magnets, the interrupter contacts in each switch being included in an operating circuit of the associated stepping mag-

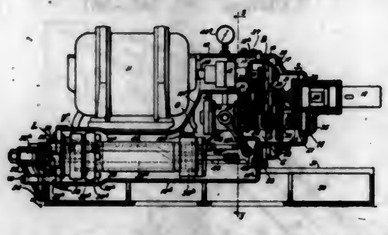
net in the same switch and in an operating circuit of the stepping magnet of the other switch whereby the stepping magnets are simultaneously energized under control of the interrupter

contacts in either switch and simultaneously deenergized under the joint control of the interrupter contacts in the several switches to step the wipers of the switches in unison.



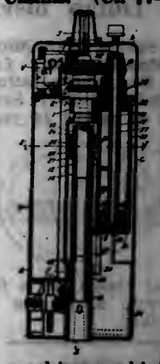
2,106,778
ELECTRIC TOASTER
John D. Morgan, South Orange, N. J., assignor to Power Patents Company, Hillside, N. J., a corporation of Maine
Application September 17, 1936, Serial No. 101,237
3 Claims. (Cl. 219—19)

1. In an electric toaster, a plurality of ceramic hot plates mounted in parallel spaced relation on a supporting frame having relatively movable plate supporting elements, each hot plate comprising a metal resistor filament embedded in a ceramic plate having an integral smooth ceramic heating surface, each of said plates composed essentially of a mixture of about 40 to 50 parts of zircon, 60 to 50 parts of finely ground ferrosilicon bonded with about 6% of phosphoric acid, parallel motion connecting links and guide members for the movable elements of the frame whereby the spacing between the hot plates can be varied to accommodate slices of bread and sandwiches, and conductors connecting the resistor filaments in series with a source of electric current.



2,106,779
MULTIPLE MACHINE TOOL
Robert A. Schafer, Charles H. Muhl, Earl E. Opel, and John B. Reissman, Richmond, Ind., assignors to The National Automatic Tool Company, Richmond, Ind., a corporation of Indiana
Application August 15, 1933, Serial No. 685,242
40 Claims. (Cl. 77—32)

11. In a machine tool a work-carrier comprising a pair of spaced apart slide-bars; a work holding fixture adjacent said carrier; a work-transfer device movable transversely to the movement of said work-carrier; hydraulically actuated means to give said work-carrier an indexing movement to move a workpiece carried thereby into the path of movement of said work-transfer device; hydraulically actuated means to advance said work-transfer device to cause it to remove a workpiece from said work-carrier and place it in said fixture; means supplemental to the last named means to retain said transfer device in



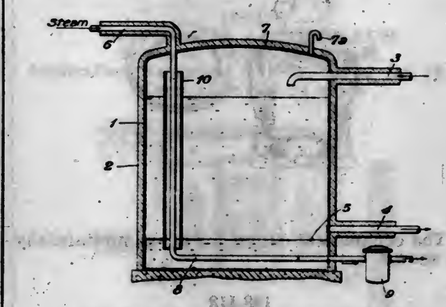
advanced position; and a tool adapted to operate on said workpiece while it is held in said fixture by said work-transfer device.

2,106,780
SUBMERGED MOTOR
Lawrence L. Schauer, Wyoming, and John H. McKewen, Cincinnati, Ohio, assignors to The Cincinnati Bickford Tool Company, Cincinnati, Ohio, a corporation of Ohio
Application September 10, 1935, Serial No. 39,884
10 Claims. (Cl. 77—32)

1. A unitary machine tool assembly combining a frame member having opposed upstanding sidewalls; guideways formed along the upper edges of said walls; a tool head slidably mounted on said guideways and having a longitudinally arranged fully closed oil compartment for propelling liquid extending a substantial distance inwardly between the said side walls of said frame member; a tool spindle journaled in said head; an hydraulic power transmission for propelling said head along said guideways and for rotating said spindle including a prime mover carried bodily by said head, a pump located in said oil compartment, driving connections between said pump and prime mover and between said spindle and said prime mover, a power cylinder located in the lower portion of said oil compartment and secured to and translatable with said head, a non-translatable piston and piston rod in said cylinder, the axis of said cylinder, piston and piston rod being longitudinally disposed within said oil compartment; and means mounting said cylinder in said head and said piston and piston rod to said frame in a position such that the axis of said members lies substantially in the plane of the said opposed guideways, said last named means including a combined cylinder head and supporting bracket member for closing the rod end of said cylinder and the ajacent end of said oil compartment and for mounting said cylinder in fixed relation to said slidable head member within the lower portion of said oil compartment.

2,106,781
CYLINDER MOUNTING FOR HYDRAULIC MOTORS
Lawrence L. Schauer, Wyoming, and John H. McKewen, Cincinnati, Ohio, assignors to The Cincinnati Bickford Tool Company, Cincinnati, Ohio, a corporation of Ohio
Application March 28, 1933, Serial No. 663,168
6 Claims. (Cl. 77—32)

4. A drilling machine combining a head member, a translatable drill spindle assembly supported within and substantially enclosed by said head, comprising a rotatable and axially translatable spindle shaft member and a non-rotatable spindle sleeve member translatable therewith; hydraulically actuated means located within said head and laterally offset from the axis of said spindle assembly for translating said assembly; a pair of axially aligned spaced guide means for guiding end portions of said assembly, the space between adjacent ends of said guide means being substantially equal to the distance of available translation of said assembly; said hydraulic means including a piston element and a relatively translatable cooperating cylinder element; and a rigid connection between one of said elements and said assembly intermediate said spaced guide means and bodily translatable in said head in the region between said spaced guide means for translating said assembly.



2,106,782
VULCANIZATION OF RUBBER
Robert L. Sibley, Nitro, W. Va., assignor, by mesne assignments, to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Application November 23, 1935, Serial No. 51,223
10 Claims. (Cl. 18—53)

1. The process of vulcanizing rubber which comprises heating rubber and sulfur in the presence of a diphenyl guanidine salt of benzene sulfonic acid and in addition thereto the reaction product of dimethylol urea and mercaptobenzothiazole.

2,106,783
PROCESS OF SEPARATING INORGANIC SALTS FROM SOLUTIONS
George W. Smith, Pittsburgh, Pa., assignor to Hall Laboratories, Inc., Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application March 12, 1936, Serial No. 68,445
8 Claims. (Cl. 23—59)

5. A process of separating an inorganic salt of the group consisting of sodium chloride, trisodium phosphate and ammonium sulphate from a solution containing the same and in addition an impurity of the group consisting of alkaline earth metal salts and salts of divalent heavy metals, which comprises adding an alkali-metal hexametaphosphate to the solution to hold the impurities in solution, and evaporating the solution to precipitate the inorganic salt.

2,106,784
STORAGE TANK
Thomas E. Stockdale, Hammond, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application June 15, 1936, Serial No. 85,188
2 Claims. (Cl. 220—85)

1. In a large capacity type of tank for storing a body of fusible normally solid hydrocarbon material such as wax, wherein there is provided a tubular heater disposed adjacent the bottom of the tank for producing liquefaction of the material adjacent a draw-off line for causing it to flow therethrough; the combination therewith of means for quickly establishing a pressure relief passageway through said body of solid material between the top thereof and said portion adjacent said tubular heating means, whereby to relieve the pressure produced by the heating of said last named portion of said material prior to the normal penetration of heat through said body of material to the upper portion thereof, said means comprising at least one conduit sleeve open at both ends, said sleeve extending from a point adjacent said tubular heater through said material to the top thereof and having a heating tube extending therethrough.

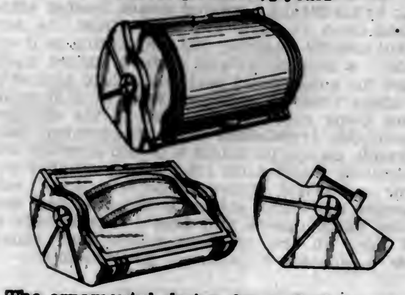
DESIGNS

FEBRUARY 15, 1938

108,417
DESIGN FOR A JUG
Jay L. Ambrose, Denver, Colo., assignor to Ambrose and Company, Denver, Colo., a corporation of Missouri
Application December 22, 1937, Serial No. 73,796
Term of patent 7 years

The ornamental design for a jug substantially as shown.

108,418
DESIGN FOR A DISPLAY STAND
Samuel Bloomfield, Chicago, Ill.
Application July 10, 1937, Serial No. 70,356
Term of patent 7 years

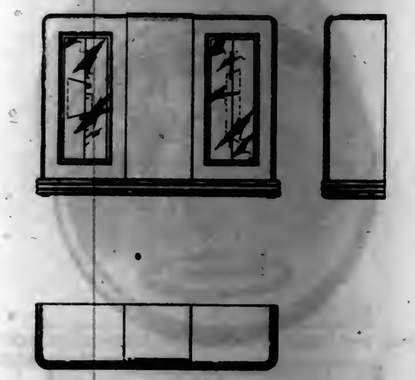


The ornamental design for a display stand, as shown.

108,419
DESIGN FOR A FACEPLATE FOR A SEE-GAUGE FOR LIQUID DISPENSING APPARATUS
Eric H. Bradley, Spring Lake, Mich., assignor to John Wood Manufacturing Company, Inc., Conshohocken, Pa., a corporation of Delaware
Application December 4, 1937, Serial No. 73,376
Term of patent 14 years

The ornamental design for a faceplate for a see-gauge for liquid dispensing apparatus, as shown and described.

108,420
DESIGN FOR A DISPLAY CASE FOR WATCHES
Abraham S. Braude, Chicago, Ill.
Application December 6, 1937, Serial No. 73,385
Term of patent 3½ years

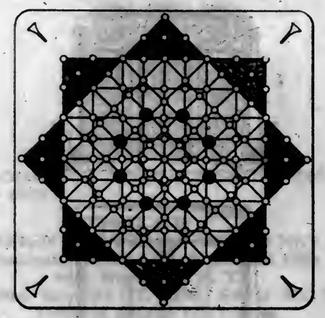


The ornamental design for a display case for watches, as shown.

108,421
DESIGN FOR A BEVERAGE TUMBLER
Allan Brill, Chicago, Ill.
Application October 28, 1937, Serial No. 72,487
Term of patent 14 years

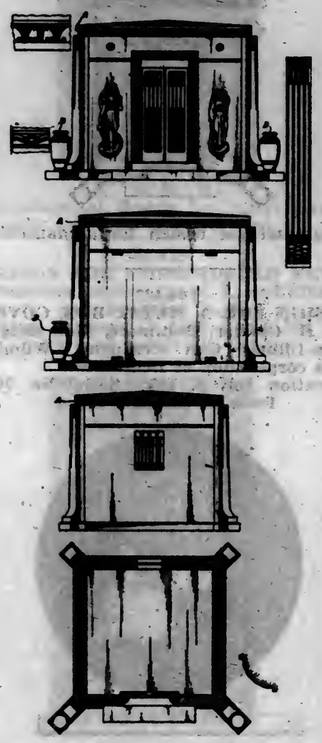
The ornamental design for a beverage tumbler, as shown and described.

108,422
DESIGN FOR AN INSTRUMENT CASE
H. Brainard Brown, Rochester, N. Y., assignor to Taylor Instrument Companies, Rochester, N. Y., a corporation of New York
Application January 5, 1938, Serial No. 74,697
Term of patent 7 years



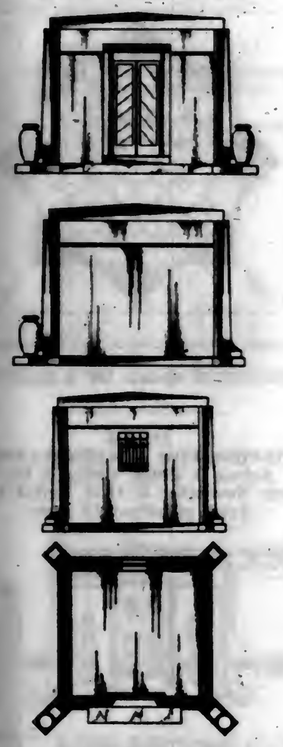
The ornamental design for an instrument case, as shown.

108,423
DESIGN FOR A COMBINED WAFFLE IRON AND TRAY OR SIMILAR ARTICLE
David Chapman, Chicago, Ill., assignor to Knapp-Monarch Company, St. Louis, Mo., a corporation of Missouri
Application July 29, 1937, Serial No. 70,725
Term of patent 7 years



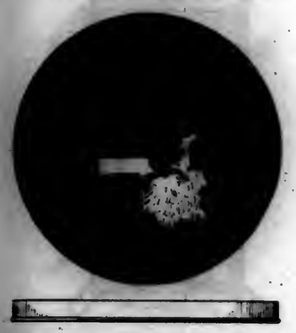
The ornamental design for a combined waffle iron and tray or similar article substantially as shown.

108,424
DESIGN FOR A GAME BOARD
Irvin W. Clary, El Paso, Tex.
Application December 15, 1937, Serial No. 73,644
Term of patent 14 years



The ornamental design for a game board as shown.

108,425
DESIGN FOR A MAUSOLEUM
Selma O. Colbe, Chicago, Ill.
Application November 6, 1937, Serial No. 72,662
Term of patent 14 years



The ornamental design for a mausoleum as shown.

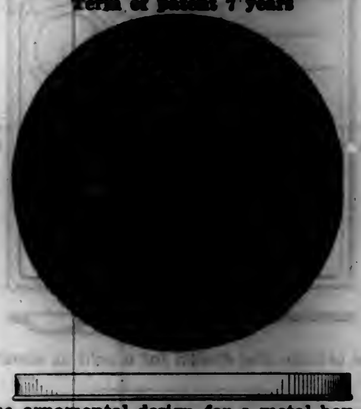
168,426
DESIGN FOR A MAUSOLEUM
Selma O. Colbe, Chicago, Ill.
Application December 17, 1937, Serial No. 73,685
Term of patent 7 years

The ornamental design for a mausoleum as shown.

168,427
DESIGN FOR A METAL BOX COVER
Martha H. Conner, Baltimore, Md., assignor to Owens-Illinois Can Company, Wilmington, Del., a corporation of Delaware
Application July 8, 1937, Serial No. 70,310
Term of patent 7 years

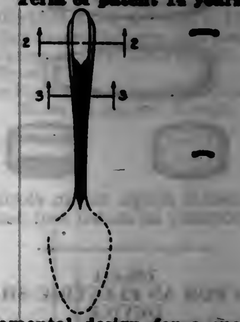
The ornamental design for a metal box cover substantially as shown.

168,428
DESIGN FOR A METAL BOX COVER
Martha H. Conner, Baltimore, Md., assignor to Owens-Illinois Can Company, Wilmington, Del., a corporation of Delaware
Application July 8, 1937, Serial No. 70,311
Term of patent 7 years



The ornamental design for a metal box cover substantially as shown.

168,429
DESIGN FOR A METAL BOX COVER
Martha H. Conner, Baltimore, Md., assignor to Owens-Illinois Can Company, Wilmington, Del., a corporation of Delaware
Application July 8, 1937, Serial No. 70,312
Term of patent 7 years



The ornamental design for a metal box cover substantially as shown.

168,430
DESIGN FOR A METAL BOX COVER
Martha H. Conner, Baltimore, Md., assignor to Owens-Illinois Can Company, Wilmington, Del., a corporation of Delaware
Application July 8, 1937, Serial No. 70,313
Term of patent 7 years

The ornamental design for a metal box cover substantially as shown.

168,431
DESIGN FOR A SPOON OR OTHER ARTICLE OF FLATWARE
Marwood A. Downs, Muncie, Ind., assignor to Ontario Manufacturing Company, Muncie, Ind., a corporation
Application December 30, 1937, Serial No. 73,988
Term of patent 14 years

The ornamental design for a spoon or other article of flatware, substantially as shown and described.

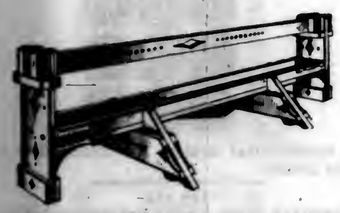
168,432
DESIGN FOR A FRINGED TEXTILE FABRIC
Samuel H. Geffner, New York, N. Y.
Application October 2, 1937, Serial No. 71,922
Term of patent 3½ years

The ornamental design for a fringed textile fabric, as shown.

168,433
DESIGN FOR EMBROIDERED LACE SCARF
Jack Goldstein, Bronx, N. Y.
Application September 9, 1937, Serial No. 71,519
Term of patent 3½ years

The ornamental design for embroidered lace scarf, as shown.

168,434
DESIGN FOR EMBROIDERED NET
Alex Grossman, Jersey City, N. J., and Ellis Axelrod, Brooklyn, N. Y.
Application January 17, 1938, Serial No. 74,365
Term of patent 3½ years



The ornamental design for embroidered net substantially as shown and described.

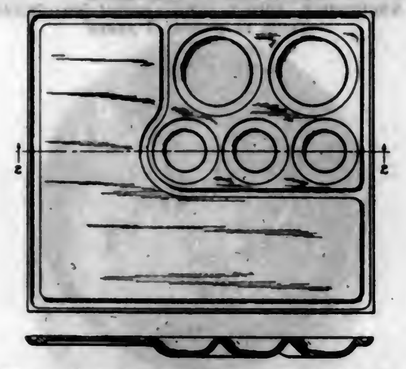
168,435
DESIGN FOR EMBROIDERED NET
Alex Grossman, Jersey City, N. J., and Ellis Axelrod, Brooklyn, N. Y.
Application January 17, 1938, Serial No. 74,367
Term of patent 3½ years

The ornamental design for embroidered net substantially as shown and described.

108,436
DESIGN FOR A FEEDING TROUGH
Ney Gwilt, Gridley, Calif.
Application December 21, 1937, Serial No. 73,787
Term of patent 3½ years

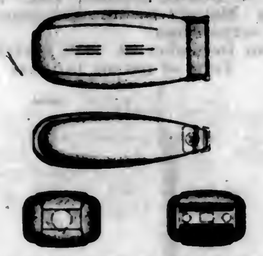
The ornamental design for a feeding trough, as shown.

108,437
DESIGN FOR A PRINTED TEXTILE FABRIC OR SIMILAR ARTICLE
Marion R. Hamre, Brooklyn, N. Y.
Application December 14, 1937, Serial No. 73,598
Term of patent 3½ years



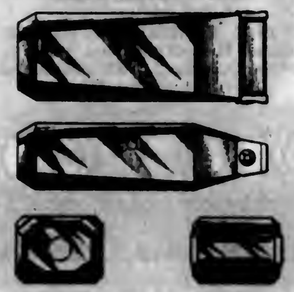
The ornamental design for a printed textile fabric or similar article as shown and described.

108,438
DESIGN FOR A PRINTED TEXTILE FABRIC OR SIMILAR ARTICLE
Marion R. Hamre, Brooklyn, N. Y.
Application December 14, 1937, Serial No. 73,601
Term of patent 3½ years



The ornamental design for a printed textile fabric or similar article as shown and described.

108,439
DESIGN FOR A GRILL
George A. Hamilton, Albany, N. Y.
Application December 8, 1937, Serial No. 73,479
Term of patent 14 years



The ornamental design for a grill as shown.

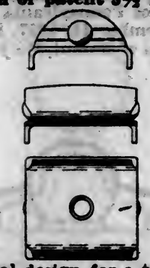
108,440
DESIGN FOR AN ELECTRIC SHAVING DEVICE
John A. Hanley, Noroton, Conn.
Application November 23, 1937, Serial No. 73,116
Term of patent 14 years

The ornamental design for an electric shaving device, substantially as shown and described.

108,441
DESIGN FOR AN ELECTRIC SHAVING DEVICE
John A. Hanley, Noroton, Conn.
Application November 23, 1937, Serial No. 73,117
Term of patent 7 years

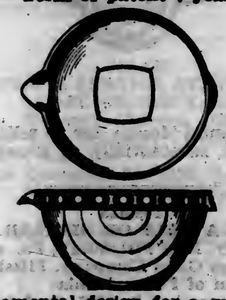
The ornamental design for an electric shaving device, substantially as shown.

108,442
DESIGN FOR A BADGE OR SIMILAR ARTICLE
Richard W. Hill, Larchmont, N. Y., assignor to The Graduate School of Banking, New York, N. Y., a voluntary association of New York
Application December 21, 1937, Serial No. 73,788
Term of patent 14 years



The ornamental design for a badge or similar article, as shown.

108,443
DESIGN FOR A TABLE LEG
Wolfgang Hoffmann, Batavia, Ill., assignor to The Howell Company, St. Charles, Ill., a corporation of Illinois
Application December 27, 1937, Serial No. 73,884
Term of patent 7 years

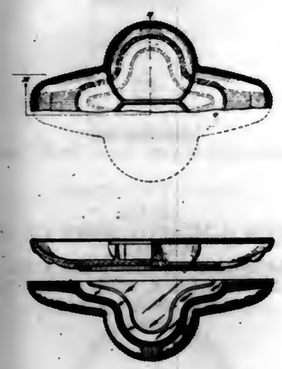


The ornamental design for a table leg, as shown and described.

108,444
DESIGN FOR A TRAFFIC MARKER
Joseph M. Huff, Oklahoma City, Okla.
Application January 27, 1937, Serial No. 67,307
Term of patent 3½ years

The ornamental design for a traffic marker, as shown.

108,445
DESIGN FOR A MIXING BOWL OR SIMILAR ARTICLE
Addis E. Hull, Zanesville, Ohio
Application November 4, 1937, Serial No. 72,626
Term of patent 7 years



The ornamental design for a mixing bowl or similar article, as shown.

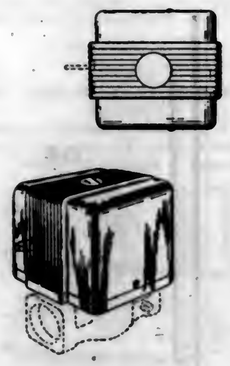
108,446
DESIGN FOR A DISPLAY STAND
Harry Stuart Johnston, Jr., Milwaukee, Wis., assignor to The Robert A. Johnston Company, Milwaukee, Wis., a corporation of Wisconsin
Application November 1, 1937, Serial No. 72,558
Term of patent 7 years

The ornamental design for a display stand, as shown and described.

108,447
DESIGN FOR A RELISH TRAY OR SIMILAR ARTICLE
Robert A. Kelly, East Pittsburgh, Pa., assignor to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application November 11, 1937, Serial No. 72,786
Term of patent 3½ years

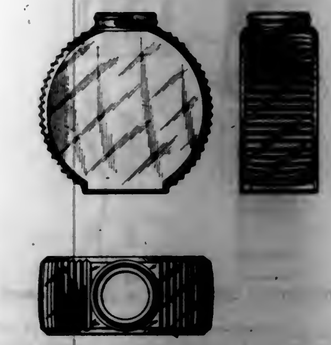
The ornamental design for a relish tray or similar article, substantially as shown and described.

108,448
DESIGN FOR A TRAY OR SIMILAR ARTICLE
Robert A. Kelly, East Pittsburgh, Pa., assignor to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application December 2, 1937, Serial No. 73,308
Term of patent 3½ years



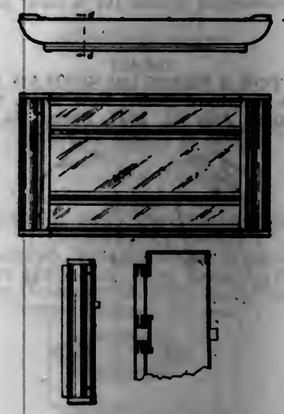
The ornamental design for a tray or similar article, substantially as shown and described.

108,449
DESIGN FOR A BOTTLE
William R. Kohl, Cumberland, Md., assignor to Carr-Lowrey Glass Co., Baltimore, Md.
Application July 10, 1937, Serial No. 70,347
Term of patent 14 years



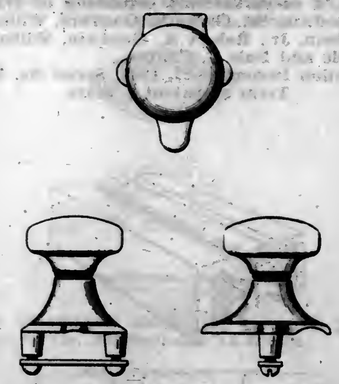
The ornamental design for a bottle, as shown.

108,450
DESIGN FOR A GAS VALVE OR SIMILAR CONTROL STRUCTURE
Eugene V. Lavallee, Des Moines, Iowa, assignor to Penn Electric Switch Co., Des Moines, Iowa, a corporation of Iowa
Application June 21, 1937, Serial No. 69,963
Term of patent 7 years



The ornamental design for a gas valve or similar control structure substantially as shown and described.

108,451
DESIGN FOR A BOTTLE
Philip G. Lloyd, Jackson Heights, N. Y., assignor to Carr-Lowrey Glass Co., Baltimore, Md.
Application August 3, 1937, Serial No. 70,822
Term of patent 14 years

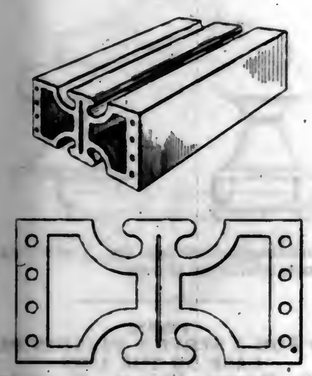


The ornamental design for a bottle, as shown.

108,452
DESIGN FOR AN INTERCHANGEABLE PRICE SIGN
Louis Manchan, Los Angeles, Calif.
Application April 28, 1937, Serial No. 69,011
Term of patent 7 years

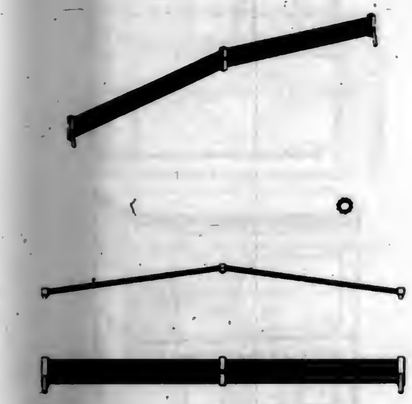
The ornamental design for an interchangeable price sign as shown.

108,453
DESIGN FOR A STEERING WHEEL KNOB
Robert L. Mertens, Los Angeles, Calif.
Application July 27, 1936, Serial No. 64,089
Term of patent 7 years



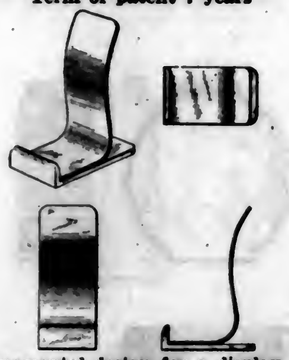
The ornamental design for a steering wheel knob substantially as shown.

108,454
DESIGN FOR A SERVICE STATION DISPLAY CASE OR THE LIKE
Ralph O. Munson, Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application December 24, 1937, Serial No. 73,852
Term of patent 7 years



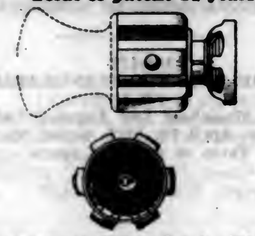
The ornamental design for a service station display case or the like, substantially as shown.

108,455
DESIGN FOR A BUILDING BLOCK OR SIMILAR ARTICLE
Fred E. Peertinga, Willmar, Minn., assignor to Redfield Brick & Tile Company, Redfield, Iowa, a co-partnership consisting of William J. Goodwin, Sr., Grace K. Goodwin, William J. Goodwin, Jr., Robert K. Goodwin, William A. Queale and Dale C. Chance
Application December 27, 1937, Serial No. 73,873
Term of patent 7 years



The ornamental design for a building block or similar article substantially as shown.

108,456
DESIGN FOR A WINDSHIELD DEFROSTING DEVICE
Warren A. Ramsay, Jersey City, N. J.
Application May 3, 1937, Serial No. 69,140
Term of patent 14 years

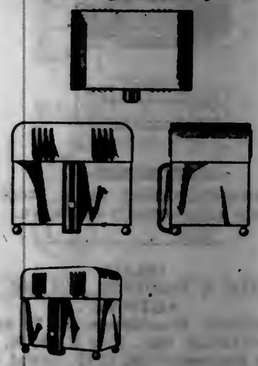


The ornamental design for a windshield defrosting device, as shown.

108,457
DESIGN FOR A DISPLAY EASEL
Carlos J. Rohde, New York, N. Y., assignor to Interstate Button Company, New York, N. Y., a corporation of New York
Application December 22, 1937, Serial No. 73,798
Term of patent 7 years

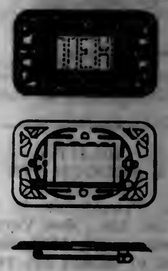
The ornamental design for a display easel, as shown.

108,458
DESIGN FOR A CIGAR LIGHTER
John Sinke, Oak Park, Ill.
Application June 21, 1937, Serial No. 69,969
Term of patent 14 years



The ornamental design for a cigar lighter, as shown.

108,459
DESIGN FOR A DRESS OR SIMILAR ARTICLE
Lillie Bernhard Starr, New York, N. Y.
Application July 23, 1937, Serial No. 70,587
Term of patent 14 years



The ornamental design for a dress or similar article as shown and described.

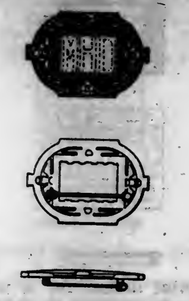
108,460
DESIGN FOR A CASING FOR A CALORIMETRIC DEVICE
Clifford Brooks Stevens, Milwaukee, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Application December 18, 1937, Serial No. 73,698
Term of patent 14 years

The ornamental design for a casing for a calorimetric device, substantially as shown.

108,461
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Coro-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,746
Term of patent 3½ years

The ornamental design for a brooch pin or similar article, substantially as shown.

108,462
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Coro-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,747
Term of patent 3½ years



The ornamental design for a brooch pin or similar article, substantially as shown.

108,463
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Coro-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,748
Term of patent 3½ years

The ornamental design for a brooch pin or similar article, substantially as shown.

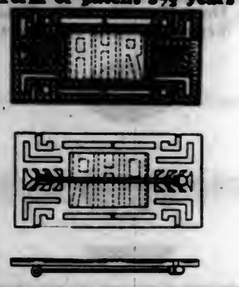
108,464
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Coro-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,749
Term of patent 3½ years

The ornamental design for a brooch pin or similar article, substantially as shown.

108,465
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Coro-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,750
Term of patent 3½ years

The ornamental design for a brooch pin or similar article substantially as shown.

168,466
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Cere-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,751
Term of patent 3½ years



The ornamental design for a brooch pin or similar article substantially as shown.

168,467
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Cere-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,752
Term of patent 3½ years

The ornamental design for a brooch pin or similar article substantially as shown.

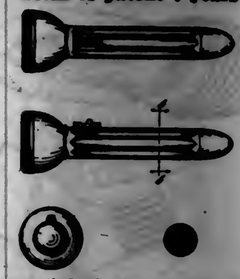
168,468
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Cere-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,753
Term of patent 3½ years

The ornamental design for a brooch pin or similar article substantially as shown.

168,469
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Cere-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,754
Term of patent 3½ years

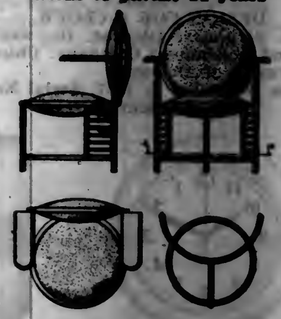
The ornamental design for a brooch pin or similar article substantially as shown.

168,470
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Cere-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,755
Term of patent 3½ years



The ornamental design for a brooch pin or similar article substantially as shown.

168,471
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
Gene Verrecchio, Providence, R. I., assignor to Cere-Gram, Inc., New York, N. Y.
Application December 20, 1937, Serial No. 73,756
Term of patent 3½ years

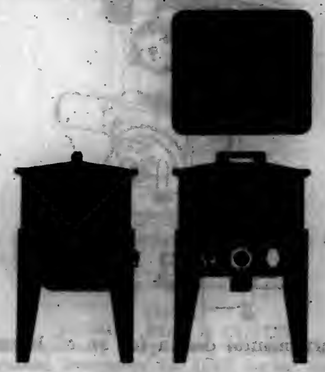


The ornamental design for a brooch pin or similar article substantially as shown.

168,472
DESIGN FOR A FLASHLIGHT
Orville T. Weed, Clinton, Mass., assignor to Blake Manufacturing Corporation, Clinton, Mass., a corporation of Massachusetts
Application September 20, 1938, Serial No. 85,060
Term of patent 7 years

The ornamental design for a flashlight as shown and described.

168,473
DESIGN FOR A CHAIR
Frank Lloyd Wright, Spring Green, Wis.
Application December 20, 1937, Serial No. 73,739
Term of patent 14 years

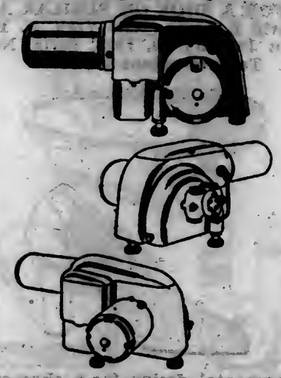


The ornamental design for a chair, as shown.

168,474
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Newton Elkin, Philadelphia, Pa.
Application January 10, 1938, Serial No. 74,181
Term of patent 3½ years

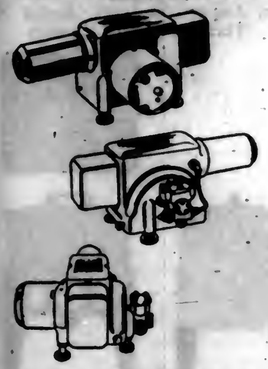
The ornamental design for a shoe or similar article, substantially as shown.

168,475
DESIGN FOR A STERILIZING UNIT OR SIMILAR ARTICLE
Henry M. Finn, Malden, and Max Laven, Boston, Mass.
Application August 25, 1937, Serial No. 71,327
Term of patent 7 years



The ornamental design for a sterilizing unit or similar article, substantially as shown and described.

168,476
DESIGN FOR A BUCKLE
John B. Freysinger, New Britain, Conn.
Application November 20, 1937, Serial No. 73,268
Term of patent 3½ years



The ornamental design for a buckle, as shown.

168,477
DESIGN FOR AN OIL BURNER
Frank E. Herr, Lancaster, Pa.
Application December 1, 1937, Serial No. 73,301
Term of patent 7 years

The ornamental design for an oil burner, as shown.

106,478
DESIGN FOR AN OIL BURNER
Frank E. Herr, Lancaster, Pa.
Application December 1, 1937, Serial No. 73,302
Term of patent 7 years

The ornamental design for an oil burner, as shown.

106,479
DESIGN FOR A SHOE
Alphons Hurseler, New Rochelle, N. Y.
Application January 10, 1938, Serial No. 74,167
Term of patent 3½ years

The ornamental design for a shoe substantially as shown.

106,480
DESIGN FOR A SHOE OR SIMILAR ARTICLE
David E. Levin, New York, N. Y.
Application January 10, 1938, Serial No. 74,182
Term of patent 3½ years

The ornamental design for a shoe or similar article, substantially as shown.

106,481
DESIGN FOR A SHOE
Ralph A. Parker, Melrose, Mass., assignor to Everlastik, Incorporated, Chelsea, Mass., a corporation of Massachusetts
Application January 17, 1938, Serial No. 74,241
Term of patent 7 years

The ornamental design for a shoe, substantially as shown.

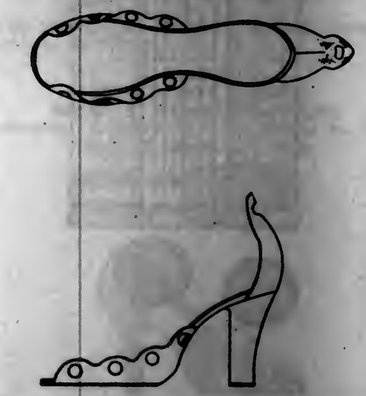
106,482
DESIGN FOR A CLOCK
George H. Stephens, Glencoe, Ill., assignor to Hammond Instrument Company, Chicago, Ill., a corporation of Delaware
Application December 4, 1937, Serial No. 73,364
Term of patent 14 years

The ornamental design for a clock as shown.

106,483
DESIGN FOR A LAUNDRY STOVE
John A. Underwood, Chicago, Ill., assignor to Montgomery Ward & Co., Incorporated, Chicago, Ill., a corporation of Illinois
Application July 15, 1937, Serial No. 70,465
Term of patent 7 years

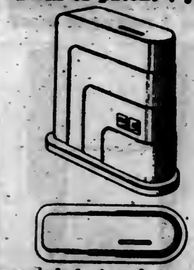
The ornamental design for a laundry stove, as shown and described.

106,484
DESIGN FOR A LAUNDRY STOVE
John A. Underwood, Chicago, Ill., assignor to Montgomery Ward & Co., Incorporated, Chicago, Ill., a corporation of Illinois
Application July 15, 1937, Serial No. 70,466
Term of patent 7 years



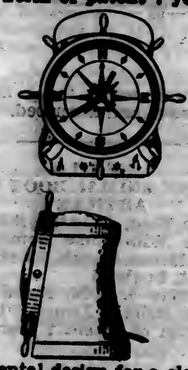
The ornamental design for a laundry stove, as shown and described.

106,485
DESIGN FOR A COMBINATION MIRROR, LIPSTICK, AND POWDER HOLDER
Sadye Elaine Wallace, New York, N. Y.
Application July 23, 1936, Serial No. 64,092
Term of patent 3½ years



The ornamental design for a combination mirror, lipstick, and powder holder.

106,486
DESIGN FOR A SHOE
Philip Weinstein, Brooklyn, N. Y.
Application January 10, 1938, Serial No. 74,174
Term of patent 3½ years

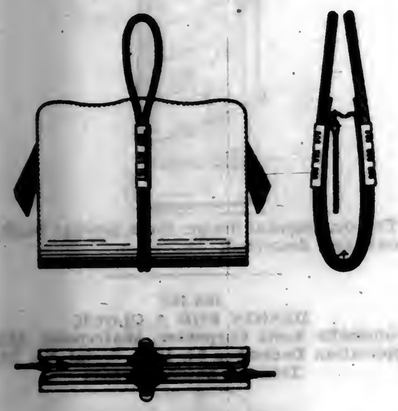


The ornamental design for a shoe substantially as shown.

106,487
DESIGN FOR A SAVINGS BANK
Jerome B. Aronson, Chicago, Ill.
Application December 23, 1937, Serial No. 73,833
Term of patent 7 years

The ornamental design for a savings bank, as shown and described.

106,488
DESIGN FOR A CLOCK
Fontinelle Scott Carpenter, Watertown, Mass.
Application December 24, 1937, Serial No. 73,870
Term of patent 7 years

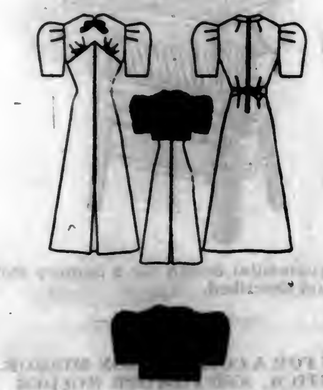


The ornamental design for a clock as shown.

106,489
DESIGN FOR AN ELECTRIC INSULATOR
Rolland E. Dalton, Fostoria, Ohio, assignor to Porcelain Products, Inc., Findlay, Ohio
Application November 29, 1937, Serial No. 73,246
Term of patent 14 years

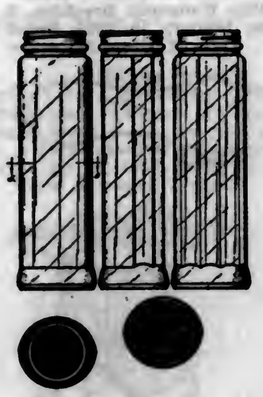
The ornamental design for an electric insulator, as shown.

106,490
DESIGN FOR A HANDBAG
Henri Feinmann, Chicago, Ill.
Application January 20, 1938, Serial No. 74,450
Term of patent 3½ years



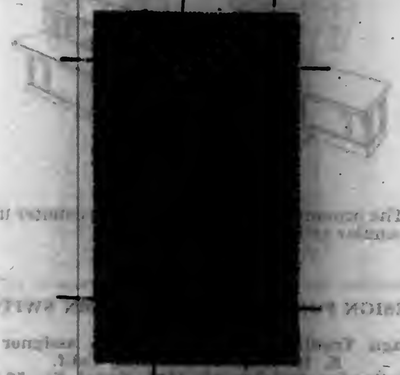
The ornamental design for a handbag, substantially as shown, and described.

106,491
DESIGN FOR AN ANIMAL BOOT OR SIMILAR ARTICLE
Frederick Percy Ford, Cheddar, Somerset, Albert Charles Cope, Winscombe, Somerset, and Arthur George Henry Gough, Tweentown, Cheddar, Somerset, England
Application May 5, 1936, Serial No. 62,486
In Great Britain January 10, 1936
Term of patent 7 years



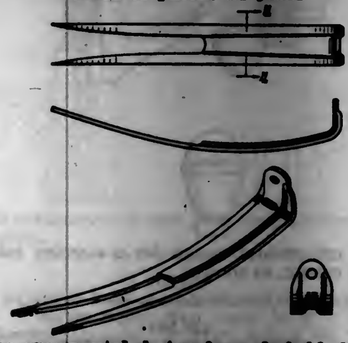
The ornamental design for an animal boot or similar article, substantially as shown and described.

106,492
DESIGN FOR A DRESS ENSEMBLE
Pauline Fraschia, New York, N. Y.
Application December 9, 1937, Serial No. 73,494
Term of patent 3½ years



The ornamental design for a dress ensemble, substantially as shown and described.

106,493
DESIGN FOR A BOTTLE
Joe C. Fuller, Deerfield, Ill., assignor to King-Fuller Co., Chicago, Ill., a corporation of Illinois
Application July 8, 1937, Serial No. 70,296
Term of patent 14 years



The ornamental design for a bottle as shown.

106,494
DESIGN FOR EMBROIDERED NET
Alex Grossman, Jersey City, N. J., and Ella Axelrod, Brooklyn, N. Y.
Application January 17, 1938, Serial No. 74,366
Term of patent 3½ years

The ornamental design for embroidered net substantially as shown and described.

106,495
DESIGN FOR A FORK BLADE
Clarence E. T. Hess, Prairie View, Ill.
Application March 24, 1937, Serial No. 68,285
Term of patent 14 years

The ornamental design for a fork blade, substantially as shown.

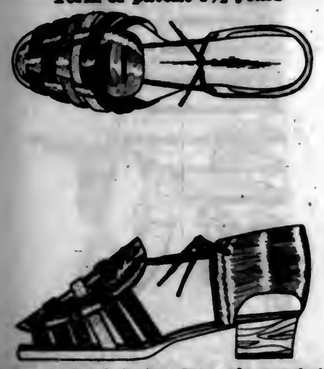
106,496
DESIGN FOR A SHOE
Adolph A. Ketsin, Chicago, Ill.
Application January 18, 1938, Serial No. 74,386
Term of patent 3½ years

The ornamental design for a shoe, substantially as shown.

106,497
DESIGN FOR A PANEL COUPLING AND SUPPORTING CLIP FOR USE IN COUNTER DISPLAY
Pierre H. Meyer, Mount Vernon, N. Y.
Application December 22, 1937, Serial No. 73,830
Term of patent 7 years

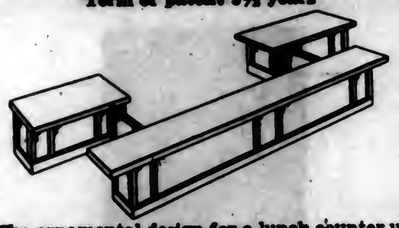
The ornamental design for a panel coupling and supporting clip for use in counter display as shown.

106,498
DESIGN FOR A RADIATOR GRILLE
John Oswald, Lansing, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 24, 1937, Serial No. 73,161
Term of patent 3½ years



The ornamental design for a radiator grille as shown.

106,499
DESIGN FOR A PHONOGRAPH
David C. Rockola, Chicago, Ill., assignor to Rock-Ola Manufacturing Corporation, Chicago, Ill., a corporation of Delaware
Application December 8, 1937, Serial No. 73,492
Term of patent 14 years



The ornamental design for a phonograph, as shown.

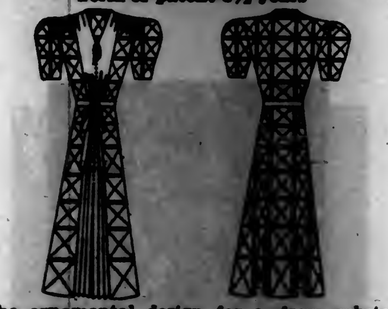
106,500
DESIGN FOR A SHOE
Max Shanzer, New York, N. Y.
Application January 12, 1938, Serial No. 74,248
Term of patent 3½ years

The ornamental design for a shoe, substantially as shown.

106,501
DESIGN FOR A LUNCH COUNTER UNIT OR SIMILAR ARTICLE
William W. Stevens, Dallas, Tex.
Application February 5, 1937, Serial No. 67,471
Term of patent 3½ years

The ornamental design for a lunch counter unit or similar article, as shown.

106,502
DESIGN FOR A STEERING COLUMN SWITCH CASING
Wagn Trautner, Springdale, Ohio, assignor to E. H. Kneffer, Oakland, Calif.
Application October 29, 1937, Serial No. 72,505
Term of patent 14 years

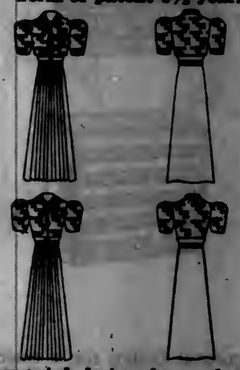


The ornamental design for a steering column switch casing, as shown.

106,503
DESIGN FOR A SCOOTER
Robert V. Ward, Richmond Hill, N. Y.
Application July 12, 1937, Serial No. 70,369
Term of patent 3½ years

The ornamental design for a scooter as shown.

106,504
DESIGN FOR A DRESS
Jacob Abbate, New York, N. Y.
Application January 18, 1938, Serial No. 74,378
Term of patent 3½ years

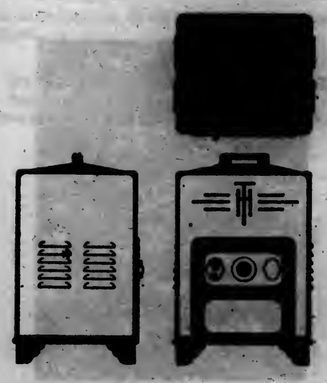


The ornamental design for a dress substantially as shown.

106,505
DESIGN FOR A DRESS
Jacob Abbate, New York, N. Y.
Application January 31, 1938, Serial No. 74,453
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

106,506
DESIGN FOR A DRESS ENSEMBLE
Helen Berry, New York, N. Y.
Application January 26, 1938, Serial No. 74,526
Term of patent 3½ years



The ornamental design for a dress ensemble substantially as shown and described.

106,507
DESIGN FOR A DRESS
Tera Coleman, New York, N. Y.
Application January 14, 1938, Serial No. 74,276
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

106,508
DESIGN FOR A STERILIZING UNIT OR SIMILAR ARTICLE
Henry M. Finn, Malden, and Max Laven, Boston, Mass.
Application August 25, 1937, Serial No. 71,326
Term of patent 7 years

The ornamental design for a sterilizing unit or similar article substantially as shown and described.

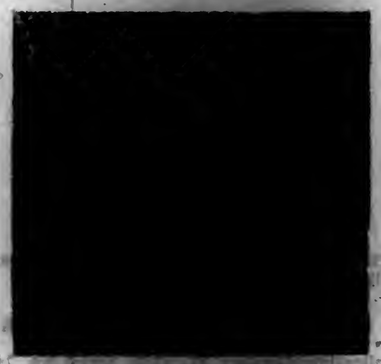
106,509
DESIGN FOR A TEXTILE FABRIC
Jacob Granowitz, New York, N. Y.
Application January 21, 1938, Serial No. 74,460
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown and described.

106,510
DESIGN FOR A TEXTILE FABRIC
Jacob Granowitz, New York, N. Y.
Application January 21, 1938, Serial No. 74,461
Term of patent 3½ years

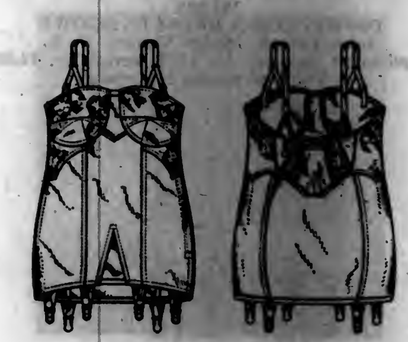
The ornamental design for a textile fabric substantially as shown and described.

106,511
DESIGN FOR A TEXTILE FABRIC
William Herm, Philadelphia, Pa.
Application January 26, 1938, Serial No. 74,550
Term of patent 3½ years



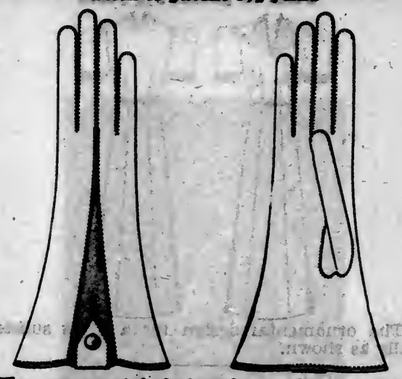
The ornamental design for a textile fabric substantially as shown.

106,512
DESIGN FOR A CASING FOR UNIT HEATER OR SIMILAR ARTICLE
Clarence R. T. Hess, Prairie View, Ill., assignor to Perfex Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application August 30, 1937, Serial No. 71,281
Term of patent 7 years



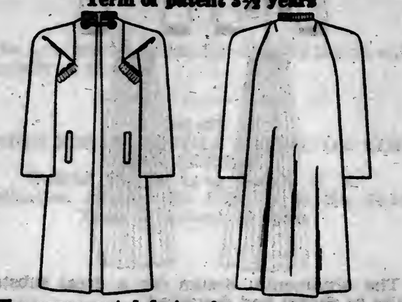
The ornamental design for a casing for unit heater or similar article, substantially as shown and described.

106,513
DESIGN FOR A TEXTILE FABRIC
John H. Haslat, New York, N. Y.
Application January 26, 1938, Serial No. 74,554
Term of patent 3½ years



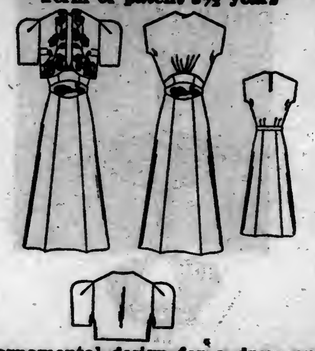
The ornamental design for a textile fabric, substantially as shown.

106,514
DESIGN FOR A COMBINATION CORSET AND BRASSIÈRE
Marie Lagumi, Aurora, Ill., assignor to International Corset Company, Aurora, Ill., a corporation of Illinois
Application December 31, 1937, Serial No. 74,026
Term of patent 7 years



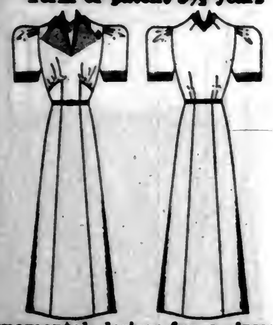
The ornamental design for a combination corset and brassière, as shown.

106,515
DESIGN FOR A GLOVE
Samuel Shapiro, New York, N. Y.
Application December 4, 1937, Serial No. 73,269
Term of patent 3½ years



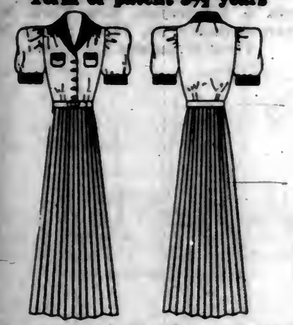
The ornamental design for a glove, substantially as shown.

106,516
DESIGN FOR A COAT
Jacob A. Silverman, New York, N. Y.
Application January 20, 1938, Serial No. 74,446
Term of patent 3½ years



The ornamental design for a coat, substantially as shown.

106,517
DESIGN FOR A DRESS ENSEMBLE
Marie Eileen Smith, New York, N. Y.
Application January 17, 1938, Serial No. 74,337
Term of patent 3½ years



The ornamental design for a dress ensemble, substantially as shown, and described.

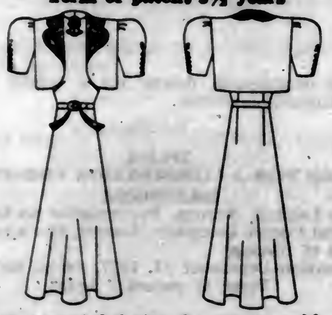
106,518
DESIGN FOR A DRESS
Jacob M. Spar, New York, N. Y.
Application January 22, 1938, Serial No. 74,469
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

106,519
DESIGN FOR A DRESS
Jacob M. Spar, New York, N. Y.
Application January 25, 1938, Serial No. 74,515
Term of patent 3½ years

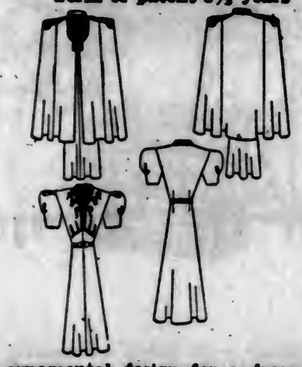
The ornamental design for a dress substantially as shown and described.

106,520
DESIGN FOR A CAPE
Max Teller, New York, N. Y.
Application January 4, 1938, Serial No. 74,081
Term of patent 3½ years



The ornamental design for a cape, substantially as shown and described.

106,521
DESIGN FOR A CAPE
Max Teller, New York, N. Y.
Application January 4, 1938, Serial No. 74,083
Term of patent 3½ years

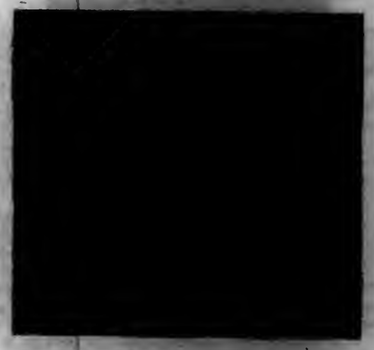


The ornamental design for a cape, substantially as shown and described.

106,522
DESIGN FOR AN ENSEMBLE DRESS
John Tuman, Mount Vernon, N. Y.
Application January 11, 1938, Serial No. 74,194
Term of patent 3½ years

The ornamental design for an ensemble dress, substantially as shown and described.

106,523
DESIGN FOR A DRESS ENSEMBLE
John Tuman, Mount Vernon, N. Y.
Application January 15, 1938, Serial No. 74,328
Term of patent 3½ years



The ornamental design for a dress ensemble substantially as shown.

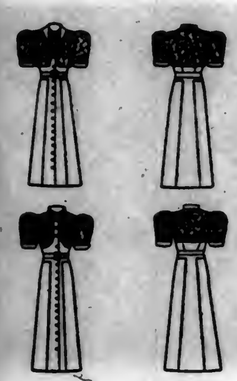
106,524
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application January 26, 1938, Serial No. 74,551
Term of patent 3½ years

The ornamental design for a textile fabric, substantially as shown.

106,525
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application January 26, 1938, Serial No. 74,552
Term of patent 7 years

The ornamental design for a textile fabric substantially as shown.

106,526
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application January 26, 1938, Serial No. 74,553
Term of patent 7 years



The ornamental design for a textile fabric, substantially as shown.

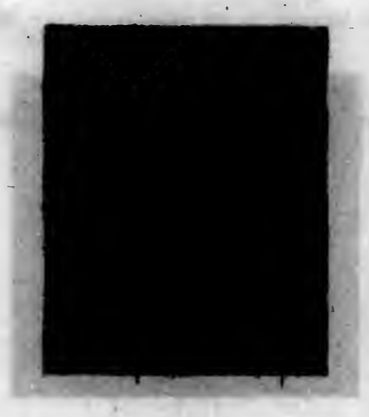
106,527
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE
Gabriel Virgile, Long Beach, N. Y.
Application January 25, 1938, Serial No. 74,517
Term of patent 14 years

The ornamental design for a textile fabric or similar article as shown and described.

106,526
DESIGN FOR A DRESS ENSEMBLE
Mildred Wagner, New York, N. Y.
Application January 26, 1938, Serial No. 74,529
Term of patent 14 years

The ornamental design for a dress ensemble substantially as shown.

106,527
DESIGN FOR A DRESS
Murray White, Brookline, Mass.
Application January 3, 1938, Serial No. 74,037
Term of patent 3½ years



The ornamental design for a dress as shown.

106,529
DESIGN FOR A DRESS
Murray White, Brookline, Mass.
Application January 3, 1938, Serial No. 74,039
Term of patent 3½ years

The ornamental design for a dress as shown.

106,531
DESIGN FOR A TEXTILE FABRIC
Nathan Wishbow, New York, N. Y.
Application January 20, 1938, Serial No. 74,430
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown and described.

Patents Nos. 2,108,785 to 2,109,448

THE OFFICIAL GAZETTE
OF THE
United States Patent Office

Vol. 487—No. 4 TUESDAY, FEBRUARY 22, 1938 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscription, $10.00 per annum, including annual index, $12.75; single numbers, 25 cents each.
PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.
CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Adjudicated Patents

(C. C. A. Wis.) Ogiesby patent, No. 1,275,294, for combined internal-combustion engine and magneto, claims 7 and 8 *Held* invalid. *Briggs & Stratton Corporation* v. *Quick Action Ignition Co.*, 93 F.(2d) 207.

(C. C. A. Wis.) Ogiesby patent, No. 1,338,151, for detachable magneto-armature heads and core, claim 3 *Held* invalid. *Id.*

(C. C. A. Ill.) Chaney patent, No. 1,497,543, for absorptive carbon and process of making the same, claims 14, 15, and 17 *Held* invalid. *National Carbon Co.* v. *Western Shade Cloth Co.*, 93 F.(2d) 94.

(C. C. A. Ill.) Chaney patent, No. 1,497,544, for absorbent charcoal and process for making the same, claims 9, 11, and 12 *Held* invalid. *Id.*

(C. C. A. Ill.) Breese patent, No. 1,522,696, for friction shock-absorbing mechanism, claim 1 *Held* valid and infringed. *Peerless Equipment Co.* v. *W. H. Miner, Inc.*, 93 F.(2d) 96.

(C. C. A. Ill.) Older patent, No. 1,534,226, for metallic expansion joint for concrete roads and the like, claims 6, 9, 10, and 12 *Held* valid and infringed. *Highway Appliances Co.* v. *American Concrete Expansion Joint Co.*, 93 F.(2d) 113.

(C. C. A. Wis.) Anderson patent, No. 1,595,958, for window frame, *Held* invalid. *Anderson Frame Corporation* v. *Hurd Lumber Co.*, 93 F.(2d) 185.

(D. C. Del.) Loutrel patent, No. 1,655,013, for compression-spring washer, *Held* invalid. *National Lock Washer Co.* v. *George K. Garrett Co.*, 21 F. Supp. 488.

(C. C. A. Ill.) Johnson patent, No. 1,730,214, for friction shock-absorbing mechanism, claims 1, 2, 3, 4, and 5 *Held* valid and infringed. *Peerless Equipment Co.* v. *W. H. Miner, Inc.*, 93 F.(2d) 96.

(C. C. A. Mass.) Cohen patent, No. 1,754,669, for heater, *Held* invalid. *Casco Products Corporation* v. *Zeiger*, 93 F.(2d) 210.

(C. C. A. Ill.) Paulin and Froom patent, No. 1,938,495, for game apparatus, claims 1, 2, 3, 6, 7, 8, 9, 18, 20, and 23 *Held* invalid. *Higby* v. *A. B. T. Mfg. Co.*, 93 F.(2d) 73.

(D. C. N. Y.) Upson patent, No. 1,957,237, for fan blade, claim 7 *Held* invalid, claims 8, 9, and 17 *Held* not infringed. *General Electric Co.* v. *Parr Electric Co.*, 21 F. Supp. 471.

(D. C. N. Y.) Gosling design patent, No. 89,076, for electric fan, *Held* not infringed. *Id.*

(C. C. A. Ill.) Hoffmann design patent, No. D-96,183, for chair, *Held* invalid. *Howell Co.* v. *Royal Metal Mfg. Co.*, 93 F.(2d) 112.

Adverse Decisions in Interference

Where the claims of a patent are affected by adverse decision or concession of priority as the result of an interference, a notice as to the patented claims thus affected will be published in the OFFICIAL GAZETTE after final decision in the proceedings.

Suggestion for the Use of Coupons

The execution of orders for printed copies of U. S. patents, trade-marks, etc., will be considerably expedited if coupons are used. Such coupons may be purchased at the Patent Office in lots of 20 at $2.00 and 100 at $10.00.

Coupon orders do not have to be accompanied by letters of transmittal. They require nothing but the filling in of the patent number, the name of the inventor, the date of issue, and the name and address of the party desiring the service.

Notice Regarding Payment of Fees

All fees must be paid in advance. Payment of money required for Office fees must be made in specie, Treasury notes, national-bank notes, post-office money orders, or certified checks. Money orders and checks must be made payable to the "Commissioner of Patents." Money sent by mail to the Patent Office will be at the risk of the sender. (See Rule 194.)

Certified checks, bank drafts, express and foreign money orders must be immediately negotiable in this country and for the full amount of the fee required by the Patent Office. No allowance can be made by this Office for any charge for their collection or exchange. Postage stamps will not be accepted. Failure to comply with the above instructions will cause delay.

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

IN RE PETERS

No. 3,869. Decided December 6, 1937

[— F.(2d) —]

PATENTABILITY—METHOD OF CRACKING HYDROCARBON OILS.

Claims for a method of cracking hydrocarbon oils *held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Messrs. Fenwick, Davis, Marvin & Edmonds for Peters.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

GARRETT, J.:

This is an appeal from a decision of the Board of Appeals of the United States Patent Office affirming a decision by the Examiner which denied the patentability of two claims, numbered 1 and 2, respectively, in appellant's application for a patent upon a method of cracking hydrocarbons.

Claim 1 is illustrative. It reads:

1. A method of treating a distillate oily composition having a stream of the oil through a heating operation and heating it in the vapor phase to a high cracking temperature, thereby maintaining the hot vapors discharged from the heating operation at a cracking temperature for a substantial period of time in a cracking operation, discharging the vapors from the cracking operation thereby into a zone in which any entrained tarry matter is precipitated by scrubbing the vapors with a liquid thereby freeing the vapors from any entrained tarry matter and in which the temperature of the vapors as discharged from the cracking operation is substantially reduced from the cracking temperature, in a scrubbing operation to form an intermediate condensate and returning the condensate therefrom to the heating operation, and discharging from the system without reintroduction into the heating operation, tar as separated in the scrubbing operation free from light oil constituents.

The particular step emphasized by appellant as lending patentability to the claims is that expressed by the clause:

discharging the vapors from the cracking operation directly into a zone in which any entrained tarry matter is precipitated by scrubbing the vapors with a liquid thereby freeing the vapors from any entrained tarry matter and in which the temperature of the vapors as discharged from the cracking operation is substantially reduced,

The decisions of the tribunals of the Patent Office are based upon anticipation by prior art, the four references cited being the following patents: Ekstrand, 1,383,415, August 23, 1921; Ellis, 1,399,000, November 15, 1921; Alexander, 1,407,619, February 21, 1922; Dubbs, 1,594,130, July 27, 1926.

In the brief of the Solicitor for the Patent Office the suggestion is offered that an adjudication by the Board of Appeals affirming the decision of the Examiner in a prior proceeding respecting an application of which the instant application is stated to be a division, became final upon the issue here involved, the cases of *In re Becker*, 22 C. C. P. A. (Patents) 943, 74 F.(2d) 806 (with its citations), and *In re Wells*, 21 C. C. P. A. (Patents) 759, 66 F.(2d) 412, being cited. This was not, however, specifically given as a ground of rejection of the instant claims by either of the tribunals of the Patent Office (although the prior decisions were referred to by both) and we have considered the case upon the merits.

The principal reference relied upon is the patent to Alexander, the others having been cited not as disclosing the step of appellant's process above quoted but as meeting certain other limitations of the counts. The brief for appellant says:

* * * the appellant concedes that if the Alexander patent does disclose the step defined by this phrase (or even its substantial equivalent), any other differences between the process defined by the appealed claims and the disclosure of the Alexander patent are not sufficiently material to sustain the patentability of the appealed claims, in view of the supplemental disclosures of the other three prior patents.

The main issues here involved therefore may be resolved into the question (1) does the Alexander patent disclose a cyclic vapor phase cracking process in which there is interposed, at the required point in the cycle, a process step the same as that defined by the above-quoted phrase, or (2) does the Alexander patent disclose a cyclic vapor phase cracking process including, at the required point, a step which is at least a substantial equivalent of the above defined step, so that the difference is obvious and merely a matter of degree. The right assignments of error, all of which are relied upon, all deal with and turn upon the answer to these questions. If the Alexander patent discloses a process including a step which is even the substantial equivalent of the step above identified, to an extent such that the man skilled in the art would thereby be taught how to solve the problem with which the present invention deals, appellant concedes that he should not prevail on this appeal, even though the exact operation disclosed in the Alexander patent might not in itself be entirely satisfactory.

We may remark in the first place that the essential elements of the claims here at issue are shown by the record to have received very extensive consideration by the tribunals of the Patent Office. It does not seem to be questioned that their subject matter was involved in appellant's original application of which the one before us is a division. The full proceedings had there with respect to them is not contained in the record, only the decision of the Board of Appeals being given in full. Sufficient appears, however, to show that they were rejected there upon the same references cited here. It is noted that, first and last, the claims have been the subject of official actions by at least three different Examiners, and also that two of the members of the Board who decided the instant case were different individuals from two of those who decided the original case. So, not only have the claims been four times the subject of final action by tribunals of the Patent Office, but at least eight different persons, all presumed to be experts in the art involved, have scrutinized and rejected them. Furthermore, it appears that the issue was several times passed upon by Examiners in the light of arguments presented upon requests for reconsideration before the Examiner's action was made final.

Obviously, therefore, the merits of the case have have had the painstaking attention of the tribunals of the Patent Office.

It is the contention of appellant that the Board failed correctly to interpret the claims, but it is conceded that the Board was of opinion that, even under appellant's interpretation, the patent to Alex-

ander discloses the step with which we are here concerned, or at least its substantial equivalent.

While appellant makes the contention alluded to as to the Board's interpretation of the claims, there is no contention that its description of the respective processes is inaccurate. These we quote.

Of appellant's process it is said:

> • • • Oil from a crude oil stock is passed through a coil 1 where it is heated to a vapor phase cracking temperature. The hot vapors then pass through the digesting chambers 5, 6, 7, and 8 where they are maintained at a cracking temperature for a substantial period. The vapors are then led into the lower end of the tower 35 and pass upwards through the tower. Hot condensate from other towers, together with crude oil, is fed into the tower 35 near the top and flows down through this tower so as to scrub the vapor passing up. The tower 35 may have baffles in it and a pool of tar may be maintained in the lower end of the tower. It is the purpose of applicant to thoroughly scrub the vapors in the tower 35 so as to remove all of the impurities, tarry matter and the carbon mist formed during cracking. The vapor passes from the tower 35 to the fractionating tower 50 where condensate is formed and separated by introducing fresh stock and condensate at the top of the tower. The condensate from the bottom of this tower is returned and mixed with the fresh stock passing to the heating coil 1 and is again vaporized.

Of the Alexander patent the Board said:

> • • • Several forms of inventions are shown in this patent but the Examiner relies on the form shown in Fig. 3. In this figure, crude oil is heated to a vapor phase cracking temperature in the still 121 and is vaporized. The vapor passes to the cracking tubes 113 and then to the lower end of the tower 110. Crude oil is pumped into the upper end of the tower 110 and contacts with the vapor passing upwards through it. The vapor passes out at the top and then passes up through the fractionating tower 117. The condensate from the tower 117 is returned to the still 121.
>
> The main objection that applicant raises to this reference is that the tower 110 is not described in detail as being a scrubbing tower. It is, therefore, argued that the patentee did not have the knowledge that it was absolutely necessary to thoroughly scrub the vapors in the tower 110 in order to eliminate the carbon mist formed in the vapor. It is true that the patentee does not speak of removing carbon mist from the vapor in the tower 110, but if the tower serves as a scrubbing tower it is evident that this will be accomplished. The Examiner refers to other forms of the invention in the patent, particularly to that shown in Fig. 5. This figure shows a tower 79 into which vapors from the cracking tubes 68 pass. The patent states that the vapors are scrubbed in this tower by incoming oil admitted at the top. The Examiner regards the tower 79 in Fig. 5 to be comparable with the tower 110 in Fig. 3 and concludes that the tower 110 is likewise a scrubbing tower.

The brief on behalf of appellant before us is quite an elaborate one and relates chiefly to the scrubbing of the vapors with a liquid which frees such vapors from entrained tarry matter.

It is conceded that in that part of Alexander's specification describing the operation of the form of apparatus illustrated in his Figure 5, the patentee "in describing the passage of the vapors through the heat interchanger 79 • • • states that the vapors 'are scrubbed by the incoming oil'," but it is urged, in effect, that this terminology was used merely to describe the action which takes place in the usual dephlegmator or heat interchanger. It is said that this type of heat interchanger is common in the industry but it is argued that the degree of contact between the liquid and vapors, while adequate for cooling the vapors and preheating the sprayed-in oil, does not remotely approach the degree of contact that would be required to separate the mechanically entrained tarry particles. The argument is further made to the effect that the fact that Alexander proposed to return all of the liquid material from the bottom of the tower directly to his heating and cracking zone shows that "Alexander had no conception of scrubbing mechanically entrained tarry particles from the vapors in the tower 79."

The question thus raised obviously is one which requires technical knowledge of the art for determination. The argument was addressed to the technicians in the Patent Office and by them overruled. The Board said:

> It may be noted that the claims appealed are quite broad. They include the step of:
>
> "Discharging the vapors from the digesting operation directly into a zone in which any entrained tarry matter is precipitated by scrubbing the vapors with a liquid thereby freeing the vapors from any entrained tarry matter."
>
> This step does not require that substantially all tarry matter, carbon mist, etc., are removed. Even if it did, we do not believe that the claims would define over Alexander. There can be no question but that the oil pumped into the top of the tower 110 in the patent will scrub out tarry matter from the vapors passing upwards. The patentee does not state how much oil is pumped into the tower but he evidently intends to pump sufficient oil into it to remove the objectionable tarry matter and impurities. If there is any difference in scrubbing, it is merely a matter of degree. If it be found that some tarry matter remained in the vapor if the scrubbing is not sufficient, it would be obvious to intensify the scrubbing to remove the objectionable impurities.

The arguments have been quite carefully considered, but we are not convinced that the conclusion reached by the tribunals of the Patent Office was erroneous. The function of scrubbing the vapors by use of a liquid is clearly taught by Alexander, and it seems clear to us that the difference in results, if any, between the operations of appellant and the patentee would be merely one of degree.

The decision of the Board of Appeals is, therefore, affirmed.[2]

Affirmed.

GRAHAM, *P. J.*, sat during the argument of this case, but died before the opinion was prepared.

Disclaimers

1,627,356.—*Heber F. Towner*, Santa Ana, Calif. DISK CULTIVATOR. Patent dated May 3, 1927. Disclaimer filed February 1, 1938, by the assignees, *Howard B. Rapp* and *Truman C. Rapp; Sally Rapp*, guardian of said *Truman C. Rapp*.

Hereby disclaim claim 17 of said patent.

1,713,628.—*Richard E. Schletter*, Philadelphia, Pa. ATTACHMENT FOR FLAT-KNITTING MACHINES. Patent dated May 21, 1929. Disclaimer filed January 31, 1938, by the assignee, *Textile Machine Works*.

Hereby enters this disclaimer to claims 1, 3, 14, and 15 of said Letters Patent.

1,776,123.—*Joy Clois Krocsen*, Belleville, N. J. SOUND RECORD. Patent dated September 16, 1930. Disclaimer filed February 1, 1938, by the assignee, *Radio Corporation of America*.

Hereby enters this disclaimer to claim 2 in said specification.

2,050,210.—*Norval Burris Griffin*, Portsmouth, Ohio. SHOE SOLE CONSTRUCTION. Patent dated August 4, 1936. Disclaimer filed January 27, 1938, by the assignee, *The Selby Shoe Co.*

Hereby enters this disclaimer to claim 1.

2,066,917.—*Fred J. Vogel*, Sharon, Pa. BUSHING. Patent dated January 5, 1937. Disclaimer filed January 14, 1938, by the assignee, *Westinghouse Electric & Manufacturing Company*.

Hereby enters this disclaimer to claims 1, 2, 3, and 6 in said specification.

Changes in Classification

Order No. 3,420, February 1, 1938, directs:

In *class 279, Chucks or Sockets* (Division 52), establish the following subclasses and definitions:

Socket type
- Lost motion
  - 19.1 Swinging external yoke or detent
  - 19.2 Rotary socket,
  - 19.3 Rotary socket,
  - 19.4 Spreading elements,
  - 19.5 Key retainer,
  - 19.6 Sleeve type retainer
  - 19.7 Sleeve in socket.

19.1. Devices under subclass 19 in which there is combined with the socket a yoke or detent mounted externally of the socket for swinging motion.

19.2. Devices under subclass 19.1 in which the socket is constructed to rotate relative to the socket holder.
Search this class, subclass 19.3, for other rotary sockets.

19.3. Devices under subclass 19 in which the socket is constructed to rotate relative to the socket holder.
Search this class, subclass 19.2, for other rotary sockets.

19.4. Devices under subclass 19 in which two or more elements are mounted for motion away from each other to release a tool from the socket and for motion toward each other to retain a tool in the socket.

Note.—For single elements movable relative to the socket for retaining a tool in the socket, see this class, subclass 19.5.

19.5. Devices under subclass 19 in which a single element is mounted for movement in guideways for retaining a tool in the socket.

19.6. Devices under subclass 19 in which a substantially annular member coacts with the socket to retain a tool therein.

Note.—In this subclass are placed sleeves mounted externally of the socket.

19.7. Devices under subclass 19.6 in which the sleeve is mounted within the socket.

The patents contained in these subclasses have been taken for the most part from class 121, Motors, Expansible Chamber Type, subclass 32.

In *class 121, Motors, Expansible Chamber Type* (Division 18), subclass 32, change the note to read:

Search Class:
279—CHUCKS OR SOCKETS, appropriate subclasses, particularly subclass 19 and indented subclasses, for lost motion sockets involving no structure of the motor or other motor tool organization.

In *class 279, Chucks or Sockets* (Division 52), subclass 19, cancel the existing note and substitute the following:
(1) Note.—These devices are used mostly for impact-drills, riveters and punches.
(2) Note.—See class 121, MOTORS, EXPANSIBLE CHAMBER TYPE, subclass 3 and indented subclasses, for sockets in combination with expansible chamber tool motor structure.

In *class 29, Metal Working* (Division 14), subclass 179, in note (3) cancel the reference to class 15, Brushing, Scrubbing, and General Cleaning.

In *class 59, Chain, Staple, and Horseshoe Making* (Division 57), subclass 78, number the existing note (1) and add the following note:
(2) Search Class:
211—SUPPORTS, RACKS, subclass 119.14.

In *class 74, Machine Elements and Mechanisms* (Division 12), subclass 242.8, in the second note insert a reference to class 211, Supports, Racks, subclass 119.09.

In *class 198, Conveyors, Power Driven* (Division 4), subclass 208, add the following note:
(3) Note.—See class 211, SUPPORTS, RACKS, subclass 119.09, for devices for tightening the loop of a clothesline.

In *class 211, Supports, Racks* (Division 8), subclass 94, number the existing note (1) and add the following note:
(2) Note.—For clotheslines which are supported by isolated supports and which have lines which are displaceable bodily, see this class, subclass 119.16. For similar lines which are displaceable vertically see this class, subclass 119.17.

In *class 248, Supports* (Division 52), subclass 61, add the following notes:
(1) Note.—For supports for clothes suspended from a taut clothesline see class 211, SUPPORTS, RACKS, subclass 119.12.
(2) Note.—For supports for trolley wires, see class 191, ELECTRICITY, TRANSMISSION TO VEHICLES, subclass 40 and indented subclasses;

in subclass 278 add the following note:
Note.—For supports for a clothesline pulley mounted on a window bracket in such a manner as to swing in two planes, see class 211, SUPPORTS, RACKS, subclass 119.06;

in subclass 289 add the following note:
(3) Note.—For clothesline pulley supports which are mounted in a window bracket in such a manner as to be capable of swinging in a horizontal plane only see class 211, SUPPORTS, RACKS, subclass 119.07;

and in subclass 291 add the following note:
(3) Note.—For clothesline pulley supports mounted on a bracket in such a manner as to swing in a vertical plane only see class 211, SUPPORTS, RACKS, subclass 119.08.

In *class 254, Pushing and Pulling Implements* (Division 61), subclass 51, insert the following under "Search classes":
211—SUPPORTS, RACKS, subclasses 119.09 and 119.15, for means permanently attached to a clothesline to tighten the same;

and in subclass 190, under "Search classes" cancel the paragraph beginning "211, Supports, Racks", and establish in lieu thereof the following:
211—SUPPORTS, RACKS, subclass 119.01 and indented subclasses, for window brackets for clothesline pulleys;

and in the same note insert after the note to class 242, the following:
248—SUPPORTS, subclass 208, for window brackets of general utility.

BULLETIN OF DECISIONS OF PATENT OFFICE ON TRADE-MARKS, LABELS, AND PRINTS

RENDERED DURING JANUARY, 1938

SANITIZED, INC., *v.* UNIVERSAL FEATHER SANITIZING MACHINE CORPORATION, Opposition No. 15,298.

In a decision rendered January 6, 1938 (159 Ms. Dec. 1,060), *First Assistant Commissioner Macklin* held that Universal Feather Sanitizing Machine Corporation, of Palmyra, N. J., is entitled to register as a trade-mark for machines for use in the cleaning of feathers, a mark consisting of the word "Sanitized" with the representation of a feather in the form of an "S" passing through the word, notwithstanding the prior registration of that same word as a trade-mark for an antiseptic for treating textile fabrics. He also held that the opposer is not entitled to have the opposition sustained since it does not show that it was organized prior to the alleged use by the applicant and does not rely upon the name clause of the statute.

With reference to the opposition, after stating that the opposer had alleged certain acts as having shown confusion and noting that no testimony was taken by either party, the Assistant Commissioner said:

"However, these matters are categorically denied by the applicant and in the absence of some proof of confusion I am obliged to hold that the goods of the applicant are not of the same descriptive properties as those of the opposer and find that there is not such likelihood of confusion as should preclude the registration sought."

WHITE HORSE DISTILLERS, LIMITED, *v.* JOSEPH A. BERSON, Opposition No. 14,891.

In a decision rendered January 20, 1938 (159 Ms. Dec. 1,061), *Assistant Commissioner Frazer* held that Joseph A. Berson, of Stamford, Conn., is not entitled to register as a trade-mark for whisky a mark comprising the words "Silver Stallion" and the showing of a stallion standing on his rear legs, in view of the prior adoption and use of the words "White Horse" either alone or in association with the picture of a white horse, as a trade-mark for the same goods.

In his decision the Assistant Commissioner said:

"I have carefully considered the arguments advanced in applicant's behalf, but I can find no escape from the conclusion that the concurrent use of these two marks on the particular goods involved would be likely to lead to confusion. In significance the expressions 'White Horse' and 'Silver Stallion' are substantially the same, and the picture of a horse certainly does not detract from the similarity of applicant's mark to the mark of opposer."

I. B. KLEINERT RUBBER COMPANY *v.* INTERNATIONAL LATEX CORPORATION, Opposition No. 15,573.

In a decision rendered January 20, 1938 (159 Ms. Dec. 1,063), *Assistant Commissioner Frazer* held that International Latex Corporation, of Rochester, N. Y., is not entitled to register as a trade-mark for baby pants, a mark comprising a picture of two babies wearing such pants, one in a crawling position and the other standing and grasping the pants of the crawling baby, in view of the prior adoption and use by I. B. Kleinert Rubber Company, of New York, N. Y., of a mark for the same goods consisting of the picture of a single crawling baby.

After stating in his decision that the Examiner of Interferences seems to have taken the position that the differences between (human) forms are very small and therefore slight differences must be sufficient to distinguish such forms when used as trade-marks, the Assistant Commissioner said:

"I am unable to adopt this reasoning. Whether or not it be the representation of a human form, I doubt that the average purchaser pays sufficient attention to any trade-mark as to retain more than a vague impression of its details.

"Opposer's mark is a picture of a crawling baby. Applicant's mark is a picture of two babies, one of which is crawling. Placed side by side, these marks could not possibly be confused, nor is it likely that a person thoroughly familiar with either would fail to distinguish the other. That, however, is not sufficient. If there is a reasonable probability that some purchasers would be deceived the second mark should not be registered. It seems to me there may be those who would retain only the impression of a crawling baby, and thus mistake applicant's goods for those of opposer. The question is a close one, but the doubt must be resolved in opposer's favor".

MAYWOOD PACKING COMPANY *v.* THE CORNING OLIVE GROWERS ASSOCIATION, Opposition No. 15,636.

In a decision rendered January 21, 1938 (159 Ms. Dec. 1,065), *Assistant Commissioner Frazer* held that the Maywood Packing Company, of Corning, Calif., is not entitled to oppose the registration by The Corning Olive Growers Association, of Corning, Calif., of a trade-mark consisting of the words "Corning Queen" in connection with a picture of a girl wearing a crown, as a trade-mark for canned olives but that the mark is not registrable to the applicant because it is merely descriptive of the goods.

As to the first point, after noting that the opposition is based upon the alleged ownership of the word "Corning" as a trade-mark of the same goods, the Assistant Commissioner held that the Maywood Packing Company, of Corning, Calif., had pleaded as a basis of the opposition ownership alone and since the word was merely geographical, being the name of the place where both parties were in business, the opposition could not be sustained.

With reference to the question of descriptiveness, he noted that queen was the name of a type of olives produced in the Corning region, and the term "Corning Queen" is therefore aptly descriptive. He further held that the association of this mark with the picture of a girl wearing a crown rendered the mark no less descriptive and the disclaimer of the

words "Corning Queen" would not make the mark registrable.

JAMES BUCHANAN & COMPANY, LIMITED, *v.* THE HAMBURGER COMPANY, Opposition No. 14,992.

In a decision rendered January 21, 1938 (159 Ms. Dec. 1,066), *Assistant Commissioner Fraser* held that The Hamburger Company, of Chicago, Ill., is not entitled to register, as a trade-mark for whisky, a mark consisting of the notation "Black Scot" associated with the representation of the head of a dog, in view of the prior adoption and use by James Buchanan & Company, Limited, of London, England, of the mark consisting of the words "Black & White", associated with the representation of two dogs, one black and one white, seated upon a block or pedestal.

In his decision after noting that the Examiner of Interferences based his decision largely on an alleged admission in appellant's brief that the only point to be decided was whether there was confusing similarity between the designations "Black & White" and "Black Scot" as used by the parties and stating that he found no such admission in the record, the Assistant Commissioner said:

"The goods of the parties are identical, namely, whisky; and it appears that both specialise in Scotch whisky. Opposer is the owner of the trade-mark 'Black & White', which was registered for such goods many years before applicant's entry into the field. Even in the absence of dogs I think this mark is too closely simulated by applicant's mark to permit of the use of both on Scotch whisky without a strong probability of confusion. The expressions 'Black Scot' and 'Black and White Scotch' have little to distinguish them, and even the dog picture in applicant's mark appears to be that of a Scotch terrier. It is true, as pointed out by applicant, that the labels now used by the respective parties are quite dissimilar; but this does not affect the question of registrability, for applicant may change its label at will. Moreover it frequently happens that whisky is ordered and sold by the drink, without opportunity for the purchaser to inspect the label."

EX PARTE BERNHARD ULMANN CO., INC., Serial No. 377,760.

In a decision rendered January 25, 1938 (159 Ms. Dec. 1,068), *First Assistant Commissioner Macklin* held that Bernhard Ulmann Co., Inc., of New York, N. Y., is entitled to register, under the act of 1905, the term "Ruffy-Flake" as a trade-mark for yarns for art needle work, although the labels show not only this mark but the mark of the actual retailer of the goods.

In his decision after noting that the applicant is the manufacturer of yarns and affixes labels bearing the trade-mark to balls and packages of yarn and that the labels bear also another trade-mark "Bonita" and the words "Made Expressly for S. H. Kress & Co." and noting further that the Examiner of Interferences had held that these labels show that the mark is not actually used by the applicant, the First Assistant Commissioner said:

"Applicant contends that the use of a trade-mark on a label is the equivalent of the use of the name of the owner of the mark, and the name of the owner of the trade-mark need not be used on the label. I think this is sound."

After discussing the question and referring to the decision in *Pro-Phy-Lactic Brush Company* v. *Lester D. Lawson*, 32 U. S. P. Q. 262; 475 O. G. 689, the First Assistant Commissioner said:

"I cannot agree that the sole purpose of requiring specimens is to furnish evidence of use by the applicant. In any event, I do not think that it is proper to deduce from the appearance of a label something contrary to the statement of facts appearing in the affidavits furnished, particularly where a set of facts is stated by the applicant consistent with matter appearing on the labels and with the statements of the application for registration."

EX PARTE CONSOLIDATED RENDERING COMPANY, Serial No. 356,832.

In a decision rendered January 25, 1938 (159 Ms. Dec. 1,067), *First Assistant Commissioner Macklin* held that the Consolidated Rendering Company, of Boston, Mass., is entitled to register, under the act of 1905, as a trade-mark for fertilizer the notation "At the Bottom of Good Crops".

In his decision after stating that the Examiner had held the mark descriptive and, in fact, not a trade-mark at all, the First Assistant Commissioner said:

"I am of the opinion that the words 'At the Bottom of Good Crops' are not descriptive of fertilizer within the meaning of the statutory provisions precluding registration on the ground of descriptiveness. I am willing to accept the applicant's statements that he has used the mark as a trade-mark and believe that it should be held to be registrable."

Then after noting that after the hearing applicant filed a paper with attached samples of orders for fertilizer designated by the phrase "At the Bottom of Good Crops", he said:

"Perhaps if these had been submitted to the Examiner he might have agreed with the applicant that the mark had a trade-mark use. In any event, in view of the above, it is now held that the Examiner was in error in holding that the mark is descriptive and did not have a trade-mark use, and it is ordered that the mark be passed for publication".

SERVEL, INC., *v.* FRED F. SUTTON, Opposition No. 15,434.

In a decision rendered January 25, 1938 (159 Ms. Dec. 1,070), *First Assistant Commissioner Macklin* held that Fred F. Sutton, of Long Beach, Calif., is not entitled to register, as a trade-mark for packed, bottled and canned pickles and sweet and sour relishes, the term "Serval".

The ground of the decision is that this mark is substantially the corporate name of the opposer "Servel, Inc."

In his decision he noted that the Examiner of Trade-Mark Interferences had held that there was no likelihood of confusion between the mark of the applicant used on the goods stated and the term "Servel" as used on refrigerators or refrigerator parts and refrigerating systems, and that he was not persuaded that the use of "Serval" would be likely to result in confusion with the applicant's mark.

With reference to the corporate name, First Assistant Commissioner said:

"The opposer's specimen and applicant's trade-mark drawing require comparison to discover that one ends with 'el' and the other with 'al'. They may be pronounced alike, or at least so nearly alike that I believe they are, within the meaning of the statute, the same word. 'Servel' is obviously the name of the corporation Servel, Inc.

"The opposer has for ten years or more advertised and popularized its corporate name and trade-mark 'Servel'. As was stated in a former case of this applicant, the notation 'Servel' has no significance other than the essential feature of the name of one person, namely: the opposer. In line with the authorities in *Beechnut Cereal Co.* v. *Beech-Nut Packing Co.*, 273 F. 367; 51 App. D. C. 5, the registration to the applicant should be and is refused."

With reference to the question of confusion in trade he said:

"The holding of the Examiner of Trade-Mark Interferences that the opposition is not sustained by the confusion in trade clause is believed to be sound."

COCA-COLA COMPANY (THE COCA-COLA COMPANY, ASSIGNEE SUBSTITUTED) *v.* CORN PRODUCTS REFINING COMPANY, Opposition No. 15,812.

In a decision rendered January 26, 1938 (159 Ms. Dec. 1,074), *Assistant Commissioner Fraser* held that Corn Products Refining Company, of New York, N. Y., is not entitled to register as a trade-mark for a nonalcoholic, maltless syrup for making soft drinks, the term "Dextra-Cola" in view of the opposer's well known trade-mark "Coca-Cola".

In his decision after referring to certain decisions relied upon by the applicant the Assistant Commissioner said:

"Be that as it may, I am of the opinion that the instant proceeding is virtually controlled by the decision of the Court of Customs and Patent Appeals in *Steinreich* v. *Coca-Cola Co.*, 21 C. C. P. A. 722, 67 Fed.(2d) 498, holding the marks 'Coca-Cola' and 'Vera-Coca' to be confusingly similar, and upon that ground refusing to permit registration of the latter. 'Dextra-Cola' is, I think, even more nearly like opposer's mark than is 'Vera-Coca'. Certainly it cannot be said to be less so."

Then after stating applicant insisted that having disclaimed the word "Cola" that word is descriptive and should be disregarded in comparing the marks, Assistant Commissioner said:

"A sufficient answer is that opposer's mark was long since registered, and its validity is not open to question in this proceeding. But even assuming the word to be descriptive, neither that fact nor applicant's disclaimer would obviate the probability of confusion. The marks must be considered in their entireties, including such features as may be descriptive whether disclaimed or not. *Shelly Oil Co.* v. *Powerine Co.*, 24 C. C. P. A. 790, 86 Fed.(2d) 752; *Joseph Tetley & Co.* v. *Bay State Fishing Co.*, 23 C. C. P. A. 969, 83 Fed.(2d) 290.

EX PARTE BAILEY METER COMPANY, Serial No. 349,262.

In a decision rendered January 26, 1938 (159 Ms. Dec. 1,072), *Assistant Commissioner Fraser* held that the Bailey Meter Company, of Cleveland, Ohio, is not entitled to register, under the act of 1905, as a trade-mark for meters and devices adapted to continuously indicate the rate of flow of two or more flowing fluids of a power producing or utilizing apparatus, the term "Boiler Meter".

In his decision after noting that the application as filed showed only the word "Boiler", that an amendment was thereafter filed seeking to add the word "Meter" to the drawing, but the Examiner had disapproved it, but through some inadvertence, had not notified the applicant and the case throughout had been treated as though the mark in question were the words "Boiler Meter", Assistant Commissioner Frazer said:

"Obviously the word 'Meter' is the generic name of applicant's goods, and it is conceded in the brief on appeal that 'the specific meter or device to which the mark is applied might in some instances be used as a means for indicating the flow of steam from a boiler.' That it actually is employed for this purpose is evidenced by the specimens on file. When so used, I cannot escape the conclusion that 'boiler meter' is merely the name of the device, and hence incapable of trade-mark significance. This being true, the fact that the device is also suitable for other uses does not, in my opinion, affect the question of registrability".

Then after noting that applicant had filed a number of affidavits tending to support the contention that the expression "Boiler Meter" had never been used by any other manufacturer of similar equipment, the Assistant Commissioner said:

"This may well be true, but it does not necessarily follow that the expression is a valid trade-mark. Regardless of its significance to the trade it remains the name of applicant's device, and as such is of course merely descriptive thereof."

Then with respect to the question whether, if not registrable under the act of 1905, the mark would be registrable under the act of 1920, Assistant Commissioner said:

"While the question is not properly before me, and the opinion here expressed will not preclude applicant from presenting the matter anew by petition from any decision the Examiner may render in that regard, I will say that I do not now believe the alleged trade-mark to be proper subject matter for registration even under the 1920 act. It is true that descriptive terms may be registered under that act, provided they function also as trade-marks; but the mere name of particular goods can never function as a trade-mark for such goods."

FRANKFORT DISTILLERIES, INCORPORATED, *v.* DEXTORA COMPANY, Opposition No. 13,303.

In a decision rendered January 29, 1938 (159 Ms. Dec. 1,075), *Assistant Commissioner Frazer* held the prior use of the Frankfort Distilleries, Incorporated, of Louisville, Ky., of the words "Duffy Malt" as a trade-mark for malt whisky was not a sufficient ground for refusing registration to Dextora Company, of Indianapolis, Ind., of a mark consisting of the notation "Duffy's" in ordinary type below which appears two concentric circles, a portion of the outer circle merging with the lower edge of the border, as a trade-mark for malt syrup for food purposes and cereal sugar. He held, however, that the mark was not registrable by the applicant since it included the name "Duffy" not reproduced in a particular or distinctive manner.

With reference to the opposition after stating that the Examiner of Interferences had relied in his ruling that the goods of the parties were of the same descriptive properties, on the decision of the Court of Appeals of the District of Columbia of *Four Roses Products Co.* v. *Small Grain Distilling & Drug Co.*, 58 App. D. C. 299, 29 Fed.(2d) 959, and noting that the decision was rendered at a time when malt syrup was intended for and actually used for making a home brew with greater alcoholic content than then allowed by law, the Assistant Commissioner said:

"So far as the present record discloses applicant's malt syrup is neither intended nor used for any such purpose. It is a grocery product chiefly employed in cooking and baking. In my opinion, when considered in connection with the changed conditions resulting from the repeal of prohibition, this difference in use sufficiently distinguishes the instant case from the one cited".

With reference to the mark being unregistrable to applicant because the name "Duffy" is not distinctively displayed, the Assistant Commissioner referred to two decisions of the Court of Appeals of the District of Columbia, namely, *In re Artesian Manufacturing Co.*, 37 App. D. C. 118, and *Oliver Chilled Plow Works* v. *The William J. Oliver Manufacturing Co.*, 40 App. D. C. 125, in which that court had approved the ruling of the Patent Office of an earlier case, that the controlling principle relative to the registration of a mark consisting of a name written in a distinctive manner is that

". . . the distinctive manner in which the name is displayed must be of a character as to give such a distinct impression to the eye of the ordinary observer as to outweigh the significance of the mere name,"

and said:

"In each case registration was refused by the court because the name sought to be registered was not displayed in a 'particular or distinctive manner.' The mark considered in the Oliver case, which is reproduced in facsimile in the opinion, is far more distinctive in appearance than is applicant's mark; and certainly the latter does not meet the requirement approved by the court. I think the ex parte refusal to register was proper".

BELDING HEMINWAY COMPANY *v.* E. P. REED & CO., Opposition No. 15,781.

In a decision rendered January 31, 1938 (159 Ms. Dec. 1,078), *Assistant Commissioner Frazer* held that E. P. Reed & Co., of Rochester, N. Y., is not entitled to register as a trade-mark for shoes a mark consisting of a front view picture of a kitten's head and forepaws with the words thereabove "Soft as a Kitten's Ear", these words being disclaimed in view of the use in registration by Belding Heminway Company, of New York, N. Y., of a trade-mark for hosiery consisting of a front view picture of a kitten's head with a spool of thread suspended from its mouth, beneath which is printed the word "Corticelli".

In his decision after noting that marks must be considered in their entireties in determining the question of confusing similarity, and that disclaimed or descriptive matter may not properly be disregarded, the Assistant Commissioner said:

"But I do not believe that either the notation of applicant's mark, or the word of opposer's is sufficient to render the two marks so distinctively dissimilar as to warrant the registration here sought. Shoes and hosiery are closely associated in use and in the mind of the public. They are frequently sold in the same stores and over the same counters. The average purchaser does not remember the details of trade-marks, nor is he required to do so. He may easily forget the forepaws of applicant's kitten, and as easily overlook the absence of the spool of opposer's mark. His impression of either mark may be merely the head of a kitten, in which case confusion as to origin of goods would seem reasonably likely to occur. The question is not free from doubt; but such doubt, as the courts have so many times reiterated, must be resolved in favor of the first user".

TRADE-MARKS

OFFICIAL GAZETTE, FEBRUARY 22, 1938

[VOL. 487. No. 4]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

119,626. COFFEE. Registered December 11, 1917. AMERICAN COFFEE COMPANY OF NEW ORLEANS, LTD. Renewed December 11, 1937, to American Coffee Company, Inc., New Orleans, La., a corporation of Louisiana, assignee.

119,887. CERTAIN NAMED PAINTS AND PAINTERS' MATERIALS. Registered December 18, 1917. FELTON, SIBLEY & CO., INC., Philadelphia, Pa., a corporation of Pennsylvania. Renewed December 18, 1937.

119,888. CERTAIN NAMED MEASURING AND SCIENTIFIC APPARATUS. Registered December 18, 1917. HERBERT FORESTER. Renewed December 18, 1937, to Wilfred G. Forester, administrator of the estate of Herbert Forester, deceased, doing business as Veritas Firing System Company, Trenton, N. J., successor.

120,072. CERTAIN NAMED TOILET PREPARATIONS. Registered January 8, 1918. WALLACE B. COATES, JR., Lynn, Mass. Renewed January 8, 1938, to Wallace B. Coates, Jr., North Andover, Mass.

120,218. DRINKING-FOUNTAINS AND PARTS THEREOF INTENDED FOR HUMAN BEINGS. Registered January 15, 1918. PURO SANITARY DRINKING FOUNTAIN CO. Renewed January 15, 1938, to Reuben B. Hills, doing business as Puro Sanitary Drinking Fountain Co., Haydenville, Mass., successor.

120,279. AN INSECTICIDE USED FOR DESTROYING INSECTS. Registered January 29, 1918. NICOTINE MFG. CO., St. Louis, Mo., a corporation of Missouri. Renewed January 29, 1938.

120,381. BEARINGS FOR MACHINERY. Registered February 5, 1918. GENERAL ELECTRIC COMPANY, Schenectady, N. Y., a corporation of New York. Renewed February 5, 1938.

120,479. HAIR-NETS. Registered February 12, 1918. NATHAN B. COHEN. Renewed February 12, 1938, to N. B. Cohen Company, Scranton, Pa., assignee by mesne assignments.

120,635. TEA, FLAVORING EXTRACTS FOR FOODS, VINEGAR, CANNED SALMON, SPICES, AND RED PEPPER. Registered February 19, 1918. F. E. ROYSTON & COMPANY, INC., Aurora, Ill., a corporation of Illinois. Renewed February 19, 1938.

120,737. APPARATUS FOR RECTIFYING ALTERNATING CURRENT. Registered March 5, 1918. GENERAL ELECTRIC COMPANY, Schenectady, N. Y., a corporation of New York. Renewed March 5, 1938.

120,992. CERTAIN NAMED HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES. Registered March 19, 1918. THE NATIONAL SUPPLY COMPANY, Toledo, Ohio. Renewed March 19, 1938, to The National Supply Company, Pittsburgh, Pa., a corporation of Pennsylvania, assignee by mesne assignments.

121,213. COCKTAILS COMPOSED OF VERMOUTH, WINE, AND BITTERS, OF WHICH THE PREDOMINATING INGREDIENT IS WINE. Registered April 16, 1918. ALEX D. SHAW & CO. Renewed April 16, 1938, to Alex D. Shaw & Co., Inc., New York, N. Y., a corporation of New York, assignee.

121,320. CERTAIN NAMED CUTLERY, MACHINERY, AND TOOLS AND PARTS THEREOF. Registered April 23, 1918. THE NATIONAL SUPPLY COMPANY, Toledo, Ohio. Renewed April 23, 1938, to The National Supply Company, Pittsburgh, Pa., a corporation of Pennsylvania, assignee by mesne assignments.

121,642. CERTAIN NAMED METALS AND METAL CASTINGS AND FORGINGS. Registered May 14, 1918. THE NATIONAL SUPPLY COMPANY, Toledo, Ohio. Renewed May 14, 1938, to The National Supply Company, Pittsburgh, Pa., a corporation of Pennsylvania, assignee by mesne assignments.

121,760. BOOTS AND SHOES MADE OF OR CONTAINING RUBBER. Registered May 28, 1918. CONVERSE RUBBER SHOE CO. Renewed May 28, 1938, to Converse Rubber Company, Malden, Mass., a corporation of Massachusetts, assignee.

121,840. SHOES MADE OF LEATHER, CANVAS, RUBBER, AND A COMBINATION OF SAID MATERIALS. Registered May 28, 1918. ALBERT H. WEINBRENNER CO., Milwaukee, Wis., a corporation of Wisconsin. Renewed May 28, 1938.

121,858. PREPARATIONS FOR TREATING CERTAIN NAMED DISEASES. Registered June 11, 1918. BOERICKE & TAFEL, INC., Philadelphia, Pa., a corporation of Pennsylvania. Renewed June 11, 1938.

122,114. BABBITT METAL. Registered June 25, 1918. SYRACUSE SMELTING WORKS, Brooklyn, N. Y. Renewed June 25, 1938, to Syracuse Smelting Works, New York, N. Y., a corporation of New York.

LABELS

REGISTERED FEBRUARY 22, 1938

50,735.—*Title:* LA DOÑA LOTION. For Skin Lotion. ALDRICH OF HOLLYWOOD, Hollywood, Calif. Published September 16, 1936.

50,736.—*Title:* BEECH-NUT COFFEE. For Coffee. BEECH-NUT PACKING COMPANY, Canajoharie, N. Y. Published December 17, 1937.

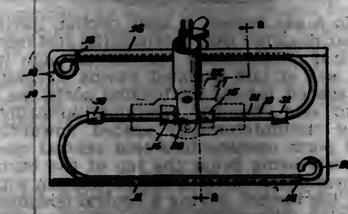
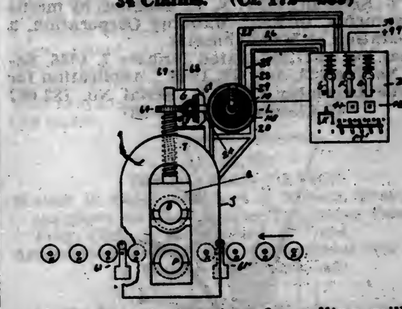
REISSUES



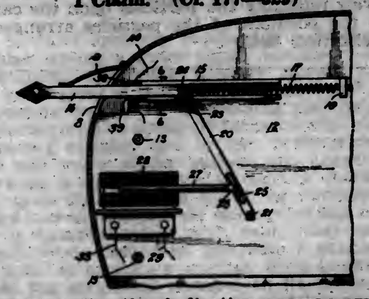
FEBRUARY 22, 1938

20,656
REFRIGERATING APPARATUS
Bertram B. Geyer, Dayton, Ohio, assignor; by mesne assignments, to General Motors Corporation, a corporation of Delaware
Original No. 1,940,699, dated December 26, 1933, Serial No. 466,004, July 17, 1930, Renewed May 15, 1933. Application for reissue December 20, 1935, Serial No. 55,491
20 Claims. (Cl. 62—108.5)



1. In freezing apparatus for liquids, the combination of a tray for making ice cubes, a grid within said tray adapted to form a plurality of ice cube molds, and cam means for expanding said grid and for raising the grid from the tray.

20,657
FLOOR POLISHING DEVICE
John Glover, Chicago, Ill., assignor, by mesne assignments, to Midway Chemical Co., Jersey City, N. J., a corporation of New Jersey
Original No. 1,982,262, dated December 4, 1934, Serial No. 667,661, April 24, 1933. Application for reissue December 4, 1936, Serial No. 114,206
13 Claims. (Cl. 15—231)



12. In a polishing device, a plate having substantially parallel spaced-apart edge portions with metal along the edge portions being curled inwardly to provide opposed substantially parallel overhanging flanges, a stick socket having a hinged connection to said plate substantially at its middle point, spring means for detachably holding a polishing pad to said plate comprising a single piece of spring wire having substantially parallel leg portions united by a resilient, intermediate bent portion resiliently urging the leg portions outwardly, said spring means lying flat upon the upper surface of said plate with its spring leg portions underlyingly housed within the overhanging flanges of the plate portion and pressing resiliently thereagainst, said legs having free end portions located adjacent the end portions of the plate and having manually actuable grips, certain portions of the overhanging flanges at the plate terminating short of the end portions of the plate to permit access to the free ends of the leg portions for pressing the same inwardly to release the spring means from its resilient clamping engagement with the overhanging flanges of the plate.

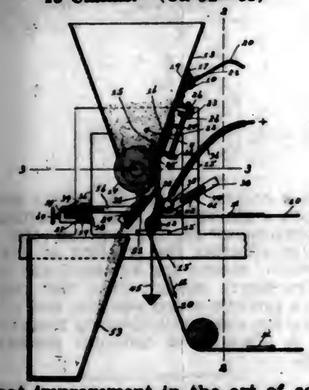
20,658
AUTOMATIC CONTROL SYSTEM FOR ELECTRIC MOTORS
Claude M. Knight, Cleveland, Ohio
Original No. 1,832,490, dated November 17, 1931, Serial No. 8,282, February 11, 1925. Application for reissue July 25, 1932, Serial No. 622,097
34 Claims. (Cl. 172—239)

12. In a control system for rolling mills provided with a plurality of rolls, in combination, a screw-down motor for shifting the rolls, manual means for effecting the starting of the screw-down motor, means for automatically stopping the screw-down motor when the rolls have reached a predetermined position, and means for presetting the automatic stopping means to function at a plurality of different predetermined positions.

20,659
VEHICLE DIRECTION INDICATOR
Amalia de Murguiondo Riggs, Cooksville, Md.
Original No. 2,082,905, dated June 2, 1937, Serial No. 101,832, September 21, 1936. Application for reissue November 29, 1937, Serial No. 177,093
1 Claim. (Cl. 177—329)

A vehicle direction indicating means, comprising a port in the side of a vehicle, stationary guiding means arranged in the vehicle adjacent to and in line with said port, a horizontally movable indicating member guided by the guiding means and adapted to be projected through said

port, means operatively connected with the indicating member for retracting the latter, a solenoid positioned substantially parallel to the guiding means and arranged within the vehicle, said solenoid having a movable member, a pivot pin fixedly positioned in the vehicle adjacent the solenoid and below the plane of the movable member, a lever having one of its ends pivotally mounted on said pin, the medial portion of the lever being provided with a longitudinal slot, a pin passing through the last-mentioned slot and secured to the movable member of the solenoid, the opposite end of the lever being also slotted, and a pin fixedly secured to the indicating member and passing through the last-mentioned slot of the lever.



20,660

METHOD OF COATING AND APPARATUS THEREFOR AND PRODUCT

Elmer C. Schacht, Troy, N. Y., assignor, by mesne assignments, to Behr-Manning Corporation, a corporation of Massachusetts

Original No. 2,027,397, dated January 7, 1936, Serial No. 296,323, July 30, 1928. Application for reissue December 27, 1937, Serial No. 182,667

45 Claims. (Cl. 91—68)

1. That improvement in the art of coating a carrier with finely divided abrasive material which consists in gravitationally supplying abrasive particles to the carrier, controlling the positions of the particles upon the carrier by the action of an electrical field substantially at their point of deposition upon the carrier, and adhesively retaining the particles upon the carrier with the positions of the particles arranged by the electrical field.

20,661

COMPOSITE BRAKE DRUM

Frank W. Schmidt, Jackson, Mich., assignor to Motor Wheel Corporation, Lansing, Mich., a corporation of Michigan

Original No. 2,014,985, dated September 17, 1935, Serial No. 601,422, March 26, 1932. Application for reissue May 11, 1936, Serial No. 79,158

4 Claims. (Cl. 188—218)

1. A brake drum comprising a brake ring having a flange at one edge thereof, a web for supporting the ring, said web having integral projections located radially inwardly of its periphery extending through and contacting the opposite surfaces of the flange to secure the web thereto, said web also having a peripheral flange contacting the ring radially outwardly of said integral projections.

20,662

GAS BURNER

Frank H. Schneider, Royersford, Pa., assignor to The Floyd-Wells Company, Royersford, Pa., a corporation of Pennsylvania

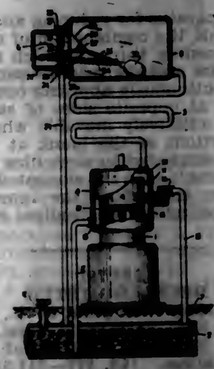
Original No. 2,040,446, dated May 12, 1936, Serial No. 728,196, May 31, 1924. Application for reissue December 24, 1937, Serial No. 181,706

3 Claims. (Cl. 158—116)

1. In a gas burner, a body portion having an annular chamber with a tangential fuel inlet and a central unobstructed opening through it, the outer wall of said chamber having circumferentially spaced, laterally extending ports, the inner wall of said chamber diverging upwardly and having circumferentially spaced upwardly inclined ports opening into said central opening, said ports being below the top of the burner, a spill-over disc secured in spaced relation with the top of the burner, having a central opening, and having an imperforate portion overhanging said ports and an utensil supporting grid fixed to said spill-over disc.

PATENTS

GRANTED FEBRUARY 22, 1938



2,108,735

COMPRESSOR COOLING SYSTEM

Burton S. Aikman, Wilkinsburg, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application April 11, 1936, Serial No. 73,854

8 Claims. (Cl. 230—212)

1. The combination with a fluid compressor having a cooling chamber through which cooling liquid may flow for cooling the compressor, of a supply reservoir adapted to contain a supply of cooling liquid and having a communication through which liquid from the reservoir is supplied to said chamber, a second reservoir communicating with said chamber into which flows liquid supplied to said chamber, means for subjecting liquid in said supply reservoir to the pressure of fluid supplied by the compressor and means operative upon a predetermined increase in the supply of liquid in the second reservoir for draining liquid from the second reservoir into the supply reservoir.

2,108,736

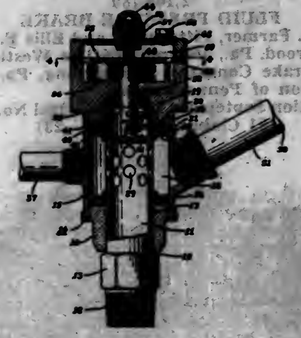
DUPLEX HIGH PRESSURE ROTARY PUMP

George E. Bigelow, Southgate, and Arthur E. Wells, Huntington Park, Calif., assignors of one-half to Pacific Pump Works, Huntington Park, Calif., a corporation of California

Application September 23, 1936, Serial No. 102,128

5 Claims. (Cl. 103—126)

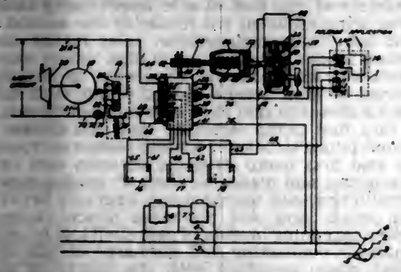
3. A rotary pump of the character described, including: a tubular shell having means for closing the ends thereof; a pair of insert pump structures in said shell in end-to-end relation, the discharge of the first of said insert pump structures being adjacent the intake of the second of said insert pump structures; inlet means connected to the intake of said first insert pump structure; outlet means connected to the discharge of said second insert pump structure; sealing means in said shell between said discharge of said first pump structure and said intake of second pump structure; sealing means surrounding said first pump structure between said inlet means and said discharge thereof; sealing means surrounding said second pump structure between said intake and said discharge means thereof; means extending outside of said shell and forming a passage connecting said discharge of said first insert pump structure with the intake of said second insert pump structure; and drive means extending into said shell and having connection with said insert pump structures whereby to drive the same.



2,108,787

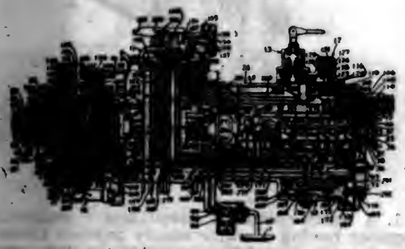
IRRIGATION DEVICE

Walter H. Coles and Bert J. Nelson, Troy, Ohio, assignors to The Skinner Irrigation Company, Troy, Ohio, a corporation of Ohio



Application February 1, 1936, Serial No. 61,851

8 Claims. (Cl. 299—69)



1. A water sprinkler comprising a supporting member having a water supply passage therein, a rotatable sprinkling member having upper and lower areas of bearing engagement with said supporting member, a distributing pipe extending outwardly and upwardly from one side of said sprinkling member and in free communication with said water supply passage and adapted to distribute a stream of water radially outwardly and upwardly from said sprinkling member, reaction means mounted on said sprinkling member in communication with said water supply passage and adapted to distribute a portion of the water to produce a reaction force tending to rotate the sprinkling member on its supporting member, a casing fixed to said sprinkling member and carried at the top thereof substantially coaxially with said supporting member, and speed controlling means in said casing exerting a substantially uniform restraining effect on rotational movements of said sprinkling member.

2,108,788
ELECTRO-PNEUMATIC BRAKE
Clyde C. Farmer, Pittsburgh, and Raymond E. Miller, Wilkinsburg, Pa., assignors to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application October 23, 1936, Serial No. 107,194
13 Claims. (Cl. 303—26)

1. In combination with a brake control mechanism, electrically controlled means for controlling the application and the release of the brakes, a manually operative switch device for controlling the operation of said means, an electric generator, a plurality of storage batteries, switch means having one position for connecting said batteries in parallel with said generator, and another position for connecting said batteries in series, and means controlled by said switch device for operating said switch means.

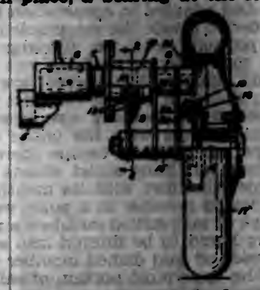
2,108,789
FLUID PRESSURE BRAKE
Clyde C. Farmer, Pittsburgh, and Ellis E. Hewitt, Edgewood, Pa., assignors to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application September 11, 1934, Serial No. 743,546
91 Claims. (Cl. 303—23)

39. In a fluid pressure brake, in combination, a brake pipe, a main brake cylinder, a take-up brake cylinder, a relay valve device operative by fluid under pressure for supplying fluid under pressure to the main brake cylinder, a cut-in valve device normally establishing communication through which the take-up brake cylinder is connected to the atmosphere, a communication through which fluid under pressure is adapted to be supplied to the take-up brake cylinder, and an equalizing valve device operative upon a reduction in brake pipe pressure for closing the first mentioned communication and for supplying fluid under pressure through the second mentioned communication to the take-up brake cylinder and to the cut-in valve device, said cut-in valve device being operated upon a predetermined increase in the pressure supplied by the equalizing valve device to cut off the flow of fluid to the take-up brake cylinder and to supply fluid under pressure to said relay valve device.

2,108,790
TUBE DRAWING APPARATUS
Sidney D. Insalso, Shelby, Ohio
Application May 9, 1934, Serial No. 724,643
10 Claims. (Cl. 205—7)

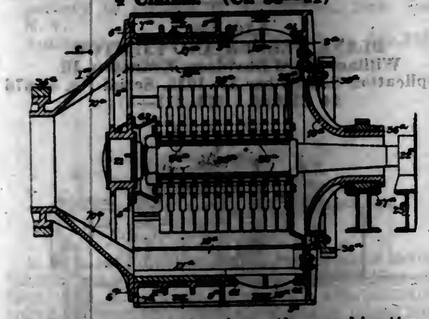
1. In an apparatus for reducing and elongating a tubular blank, the combination of a die having a restricted opening through which the blank is drawn to reduce and elongate the same, separate devices for continuously applying opposed forces to said blank at opposite sides of said die, said devices being relatively movable whereby adjecent local portions of the blank at the locality of the die are subjected to stretching action, and a mandrel movable with the elongated portions of the blank for controlling the inner diameter thereof and controlling longitudinal strain thereon.

2,108,791
DECELEROMETER
Reginald J. Alden, New York, N. Y., assignor to Chapin & Neal, Springfield, Mass., a firm
Application March 1, 1935, Serial No. 8,921
5 Claims. (Cl. 177—311.5)



4. A deceleromotor for use in motor cars which comprises, signal means to indicate an unsafe rate of deceleration, and signal means to indicate a safe rate of deceleration, an oscillatory signal actuating member normally held in inoperative position by gravity and movable by its inertia to successively actuate and deactuate said unsafe signal means and actuate said safe signal means, in response to predetermined rates of deceleration, and returnable to its inoperative position by gravity upon substantial completion of the deceleration of the car, and means automatically operative in response to the substantial completion of the deceleration of the car to prevent reactuation of the unsafe signal means during the return movement of said signal actuating member after actuation of the safe signal means.

2,108,792
GUN CARRIAGE
Orie L. Beardsley, Gary, Ind.
Application September 18, 1936, Serial No. 101,443
1 Claim. (Cl. 89—40)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



In combination with a gun carriage provided with an axle terminating in spindles adapted to receive the usual artillery wheel, crank arms, a bearing at the upper end of each crank arm to receive their respective spindles and adjacent portions of the axle, the extent of the portion receiving the axle being at least as great as that

receiving the spindle, means for securing the bearing in place, a bearing at the lower end of

each crank arm and a spindle for mounting a wheel carried by each bearing.

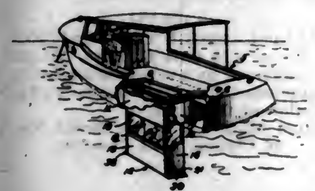
2,108,793
CRUSHING MACHINERY
George W. Berton, New Lisbon, N. J., assignor to Pennsylvania Crusher Company, Philadelphia, Pa., a corporation of New York
Original application February 2, 1931, Serial No. 512,190. Divided and this application February 26, 1934, Serial No. 712,045
4 Claims. (Cl. 83—11)

2. In a crushing structure, the combination of a cylindrical drum having a peripheral wall including an imperforate portion and a foraminous portion; each of said portions occupying substantially one-half of the longitudinal extent of the drum, means for rotating said drum, longitudinally extending ribs connecting said peripheral wall portions, an end wall section integral with said peripheral wall and including an outwardly extending hollow trunnion, a cone-shaped section having a central feed opening connected to the imperforate wall portion of said drum and providing a trunnion, supports for said trunnions, vanes carried by the cone-shaped feed section; said feed section having a plurality of radial arms disposed toward the drum with a hub axially arranged with respect thereto, a series of longitudinally disposed removably mounted grid bars partially closing the foraminous portion of said drum, lifting shelves extending the full length of the drum internally of the same whereby material introduced therein may be lifted for gravitational discharge, rotatable hammer mechanism adapted to act upon the material spilling from said lifting shelves, a shaft for said hammer mechanism extending through the hollow trunnion of the end wall, bearing supports for said shaft; one of said supports being carried by the hub of the feed section and the other support being disposed externally of the drum beyond the trunnion of the end wall, and means for driving the hammer mechanism independently of the means for rotating the drum.

2,108,794
HARD CARBIDE COMPOSITION
John A. Beyer and Carl G. Rose, Niagara Falls, N. Y., assignors, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware
Application March 23, 1935, Serial No. 12,588
10 Claims. (Cl. 75—136)

1. As a new manufacture, a fused carbide composition consisting essentially of boron carbide and silicon carbide, in which silicon carbide is present as a separate crystalline phase which has solidified from a fused mass.

2,108,795
DOUBLE-WALLED SHEET METAL STRUCTURE AND METHOD OF MAKING
Edward G. Budd, Philadelphia, Pa., assignor to Edward G. Budd Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application March 22, 1934, Serial No. 716,832
Renewed November 6, 1936
13 Claims. (Cl. 219—19)



1. The method of fabricating an insulated wall structure comprising spaced inner and outer walls and sheet metal strips, of undulating form in direction of length, whereby they stand on edge of themselves, spacing the walls apart and connecting them together through their edges per se, which comprises providing the strips with closely spaced edge projections in the plane of the strip prior to assembly of the parts in spaced relation, spacing the strips with their undulations parallel and spaced apart a distance not greater than twice their amplitude of undulation and thereafter projection welding the parts together by applying appropriate pressure at right angles to the wall structure over an extended but fractional area including a multiplicity of projections and passing current through the structure from exterior sheet to exterior sheet whereby a multiplicity of resistance welds spaced in a multiplicity of directions are simultaneously achieved throughout the same at the projections at opposite margins of the spacing strips.

2,108,796
SUBMARINE OBSERVATORY
Charles Oliver Carey, Miami, Fla.
Application June 30, 1936, Serial No. 88,228
6 Claims. (Cl. 114—66)

1. A boat having a keel extending within the bottom thereof and having an opening through

said bottom adjacent said keel, a casing secured to the bottom around said opening and to said keel to form a well, an observation well having a closed lower end and provided with windows, and

slidably mounted in the said well and movable through said opening, and means for securing the slidably mounted observation well in predetermined position relative to said keel.

2,166,797

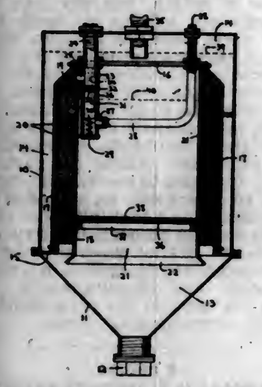
METHOD OF PRODUCING HARD CEMENTED CARBIDE COMPOSITES

Gregory J. Comstock, Fairfield, Conn.

No Drawing. Application January 22, 1935, Serial No. 2,950

16 Claims. (Cl. 75—137)

1. In the sintering process for producing articles of razor edge sharpness, the steps of controlling the hardness of the presintered composite which comprises mixing hard metal carbides with a cementing metal in powdered form, applying a pressure of more than 60,000 pounds per square inch to the composite, applying a controlled presintering temperature just short of the final sintering temperature and varying in accordance with the hardness desired; working the composite to form fine edge blades; and thereafter applying a final sintering temperature.



2,166,798

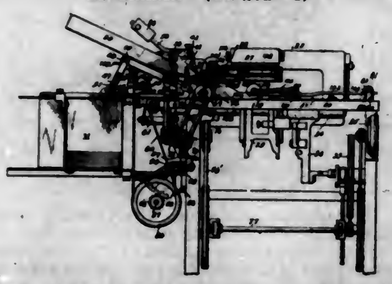
FILTER

William P. Dalrymple, Chicago, Ill.

Application November 2, 1933, Serial No. 696,475

15 Claims. (Cl. 210—167)

1. In a filter, the combination of a receptacle, a dished member open at its lower end extending partially across the receptacle at a substantial distance above the lower end of the receptacle, means comprising a filtering medium surrounding said dished member in outwardly spaced relation thereto and adapted in cooperation with said dished member to divide the receptacle into inlet and outlet portions with the filtering medium arranged in such position that the grit and dirt from the inlet chamber face thereof are adapted to settle into the lower part of the inlet chamber when released by a cleaning operation, outlet means communicating with the outlet chamber adapted to permit liquid to escape therethrough under pressure, auxiliary outlet means opening from said inlet chamber with its mouth located within said dished member at a point well above the lower edge of said dished member, and means for delivering liquid to be filtered into said inlet chamber outside of said dished member at about the level of the uppermost portion of said dished member under such pressure as to pass through said filtering medium and to escape through said first named outlet means and adapted to establish a pressure condition within said receptacle, the arrangement being such that when the delivery of liquid to said inlet chamber has ceased the pressure is relieved by the escape of liquid through said auxiliary outlet means and that the readjustment incident to such escape of liquid causes a substantial flow of liquid through said filtering medium in the reverse direction for cleaning the filtering medium.



2,166,799

BLANK FEEDER AND EJECTOR

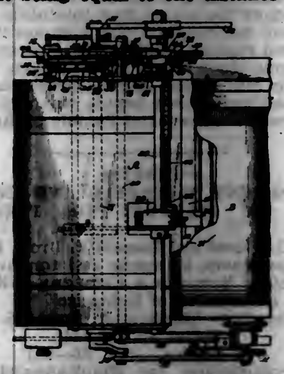
William Ward Davidson, Evanston, Ill.

Application September 30, 1935, Serial No. 42,876

14 Claims. (Cl. 271—4)

1. In a feed mechanism of the kind described for co-operation with a printing machine, a tape for moving the articles to be printed, into and out of printing position, a pulley to which one end of the tape is secured for moving the tape in one direction, a segmental gear and a co-operating pinion for intermittently rotating said pulley, and latch means for connecting the pinion to the pulley for rotating same.

2,166,800



MECHANISM FOR CONTROLLING THE FEEDING AND ADVANCING OF BLANKS

William Ward Davidson, Evanston, Ill.

Application May 9, 1936, Serial No. 78,797

17 Claims. (Cl. 271—53)

1. In a blank separating and advancing machine, means for separating and advancing a blank from a pack, controlling means disposed in the path of the advancing blank at a predetermined distance from a predetermined final position of the blank, and means controlled by said controlling means for limiting advancement of the blank after it has been advanced to said controlling means, the amount of such limited advancement being equal to the distance between

the said controlling means and the contemplated final position of the blank.

2,166,801

METHOD AND APPARATUS FOR RECORDING AND REPRODUCING SOUND-ON-FILM

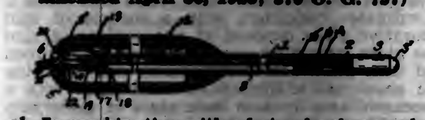
Leon Dewan, New York, N. Y., assignor of fifty percent to George E. Callaghan, New York, N. Y.

Application June 16, 1934, Serial No. 730,972

4 Claims. (Cl. 179—100.3)

1. In a sound recording or reproducing system including a light source, a photographic film surface, and a concave mirror of approximately spherical form to project an image of linear form and extreme sharpness in the direction of its width upon the photographic film, the light source and the photographic film surface being placed approximately on a line passing through the center of curvature of the concave mirror at right angles to its principal axis, the focus of said image being constant.

2,166,802



BATON

Louis F. Dorsey, Washington, D. C.

Application December 23, 1936, Serial No. 117,331

2 Claims. (Cl. 248—2)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In combination with a baton having an elongated relatively slender body of the type employed by an orchestra leader, said baton having in one end a socket and an electric lamp releasably fitting therein, a tip interchangeable with said lamp when the latter is not used, an electric conductor extending interiorly of said baton body, an electric battery and a clasp to attach the same to the operator's person, a socket in the other end of said baton body, a plug electrically connected to said battery adapted to fit in said last named socket to furnish current to said lamp, and a cap interchangeable with said plug when said battery and lamp are not used.

2,166,803

MANUFACTURE AND/OR TREATMENT OF ARTIFICIAL MATERIALS

George Holland Ellis and Alexander James Wesson, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application December 29, 1936, Serial No. 116,142. In Great Britain January 16, 1936

9 Claims. (Cl. 8—20)

1. Process for the manufacture of improved artificial textile and like products, which comprises bringing a saponifying agent into contact with selected areas only of threads, fabrics, films or like materials having a basis of organic ester of cellulose, so as to render said areas more sensitive to subsequent saponification, washing the material and thereafter exposing said areas as well as unsaponified areas of the material to a weaker saponifying agent, so as to intensify the saponification of the saponified areas without substantially saponifying the other areas.

2,166,804

MOISTUREPROOF MATERIAL AND PROCESS OF MAKING SAME

Theron G. Finzel and Donald E. Drew, Kenmore, N. Y., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

Application March 29, 1934, Serial No. 717,938

11 Claims. (Cl. 91—70)

1. A method which comprises highly calendering paper, impregnating said paper with a moistureproofing and transparentizing lacquer, the solids of said lacquer possessing the hot-flow property, evaporating the solvents from the treated paper at a temperature sufficient to cause the solids to automatically hot flow and fill the voids when the composition contains a minor portion of solvents.

2,166,805

TRANSPARENT MATERIALS AND METHOD OF PRODUCING SAME

Theron G. Finzel and Donald E. Drew, Kenmore, N. Y., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 4, 1934, Serial No. 728,857

6 Claims. (Cl. 91—68)

1. A method of making paper suitable for use as a transparent wrapping tissue which comprises calendering a thin porous sulphite tissue, passing said calendered paper through an 8% to 12% solution of paraffin wax in toluene maintained at a temperature of between approximately 35° C. and 50° C., removing the excess solution, subjecting the treated paper base to a temperature sufficient to evaporate the toluene and to melt the wax adhering to the paper, passing the wax-treated sheet through a lacquer the solids of

which consist of 62.5% of half-second nitrocellulose and 37.5% of tricresyl phosphate, and subjecting the lacquer-treated sheet to an elevated temperature to remove the lacquer solvent.

2,106,806

CELLULOSE MATERIALS AND METHOD OF TREATING SAME

Theron G. Finzel and Donald E. Drew, Kenmore, N. Y., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 26, 1934, Serial No. 732,440

9 Claims. (Cl. 91—68)

1. A process for transparentizing paper which comprises impregnating the paper with a liquid composition consisting essentially of a water-soluble soap and a liquid vehicle to provide a soap content of from 0.1% to 10.0% by weight of the cellulose material in the final product, removing the liquid vehicle whereby the said soap is distributed throughout the said paper to render the latter more absorptive for transparentizing impregnants, and impregnating the paper with a transparentizing composition.

2,106,807

TRANSPARENT MATERIAL AND METHOD OF MAKING SAME

Theron G. Finzel and Donald E. Drew, Kenmore, N. Y., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 26, 1934, Serial No. 732,441

20 Claims. (Cl. 91—68)

1. A highly calendered paper containing a wetting agent distributed throughout its mass and impregnated with a composition free of cellulose derivatives and comprising a resin in proportions which transparentizes said paper.

2,106,808

TRANSPARENT MATERIALS AND METHOD OF MAKING SAME

Theron G. Finzel and Donald E. Drew, Kenmore, N. Y., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 26, 1934, Serial No. 732,442

17 Claims. (Cl. 91—68)

1. A transparent moistureproof material comprising paper containing a wetting agent and having its voids and spaces substantially completely filled with a water-soluble impregnant and thinly coated with a transparent moistureproofing composition, said impregnant being present in an amount of 10% to 30%, by weight, of the paper.

2,106,809

MOISTUREPROOF MATERIAL AND METHOD OF MAKING THE SAME

Theron G. Finzel and Donald E. Drew, Kenmore, N. Y., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 26, 1934, Serial No. 732,443

19 Claims. (Cl. 91—70)

3. A method which comprises incorporating a wetting agent in a thin, porous paper, calendering said paper, impregnating the thus-treated paper with a moistureproofing composition in the molten state and comprising a moistureproofing wax, a hard wax and a blending agent preventing separation of the waxes and inhibiting the production of haziness in the composition when chilled and rapidly chilling the impregnated paper at some stage of the process when the composition is still in the molten condition and before crystallization has begun, whereby a transparent, moistureproof and flexible product is obtained.

2,106,810

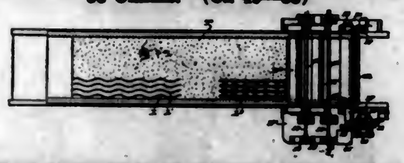
TRANSPARENT MATERIAL AND COMPOSITION OF MATTER FOR PRODUCING SAME

Theron G. Finzel and Donald E. Drew, Kenmore, N. Y., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 26, 1934, Serial No. 732,444

22 Claims. (Cl. 91—68)

1. A composition for simultaneously transparentizing and moistureproofing sheets of cellulose material comprising a lacquer containing a moistureproofing waxy substance and a substance, selected from the class which consists of glycols and glycol derivatives, for softening said cellulose material.



2,106,811

GLASS SHEET, METHOD AND APPARATUS FOR MAKING SAME

Henry A. Fisher, Parkersburg, W. Va.

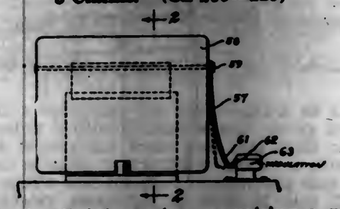
Application August 24, 1935, Serial No. 37,768

33 Claims. (Cl. 49—33)

11. As an article of manufacture, a sheet of glass comprising a base layer having a ribbon of glass of different appearance embedded therein at points spaced inwardly from the edge of the sheet, with a surface of said different glass exposed and in the plane of the surface of the base glass, the transverse dimension of said ribbon being materially less than the width of the base layer of the sheet, the opposite surfaces of said sheet being smooth and flat.

15. The method of manufacturing variegated glass sheets, which comprises providing a body of molten glass of base appearance, and a source of molten decorative glass, forming and flowing a molten stream of said decorative glass of relatively small transverse dimension with respect to the width of said body of base glass, onto the latter at a point spaced inwardly from the edge of said body of base glass and embedding said decorative glass in said base glass while said glass is in workable condition, with a surface of said decorative glass exposed at the surface of said base glass, providing relative movement between said base glass and said stream, and finishing said glass into a smooth surfaced sheet with a decorative area in said base glass of materially less width than the width of the sheet and with the exposed surface of the decorative area in the plane of the surface of the base glass.

22. In an apparatus for forming glass sheets, supply means for a quantity of molten decorative glass, means for supporting a body of molten glass of base appearance, means for forming and flowing a stream of said molten decorative glass of relatively small transverse dimension with respect to the width of said body of base glass, said last named means being positioned inwardly from the edge of the body of base glass to flow said stream onto the base glass at a point spaced inwardly from the edge of the same while said glass is in workable condition, and means providing relative movement between said base glass and said flowing means.



2,106,813

SWITCH

Lawrence R. Fisher and William H. Frank, Detroit, Mich.

Application January 13, 1936, Serial No. 58,870

5 Claims. (Cl. 200—116)

1. A circuit interrupter comprising a pair of stationary contacts, a movable insulation block having cells closely fitting around and constantly closed by said stationary contacts in all positions of the block, a contact forming a wall portion of each cell and carried by the block and movable therewith to engage or be free of a stationary contact in the corresponding cell, the block contacts being electrically connected by movable circuit current responsive means whereby the block contacts and such means bridge the stationary contacts, the circuit current responsive means comprising the movable part of a release latch which normally holds the block in closed circuit position, and means constantly tending to move the block to open circuit position and inhibited by the latch.

2,106,812

LOCK CONTROLLING MECHANISM FOR TRANSFERABLE FREIGHT CONTAINERS

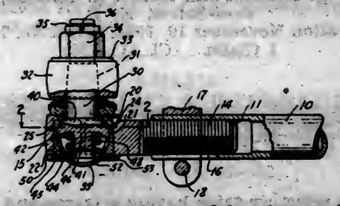
Benjamin F. Fitch, Greenwich, Conn.

Application July 18, 1935, Serial No. 32,130

17 Claims. (Cl. 214—38)

16. The combination with a support, a container adapted to rest thereon, means for moving the container from the support, means for locking the container to the support, and means actuated by the locking means for automatically preventing the attachment of the moving means to the container.

2,106,814



JOINT CONSTRUCTION

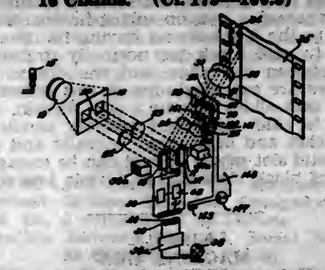
William A. Fitzgerald, Columbus, Ohio, assignor to The Columbus Auto Parts Company, Columbus, Ohio, a corporation of Ohio

Application June 22, 1936, Serial No. 86,525

8 Claims. (Cl. 287—20)

1. A joint construction including a housing having a bore therein; a bearing having an interior substantially spherically curved bearing surface, said bearing being located in said bore of said housing; a stud member having a spherically shaped portion; a second member having a spherically shaped portion and adapted to form with the spherically shaped portion of said stud member a substantially ball shaped element, said members forming the ball shaped element

both seating in said curved bearing surface; a closure for the bore of said housing, said closure having a concave inner surface forming a continuation of said curved bearing surface; and means arranged between said members for urging said spherically shaped portions into engagement with said curved bearing surface and said curved inner surface of said closure.



2,106,815

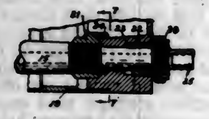
SOUND RECORDING SYSTEM

Earl S. Gillé and Benson D. Gille, Los Angeles, Calif., assignors of one-half to Robert W. Spefford, Los Angeles, Calif.

Application July 16, 1934, Serial No. 735,415

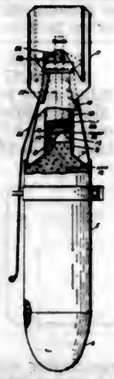
16 Claims. (Cl. 179—100.3)

4. In combination in a system for recording sound on a track of a light-sensitive surface: means for directing opposed and narrow beams of light into exposing relationship with spaced sections of said sound track, said means including a pair of independently movable mirrors, a pair of armatures operatively and respectively connected to said mirrors, and means for sending magnetic flux across said armatures; means for impressing on one of said armatures electric undulations varying in response to the complete range of sound frequencies desired to be recorded to form a first sound record on one section of said light-sensitive surface, said one of said armatures and its associated mirror being incapable of uniformly recording all frequencies within said complete range whereby said first sound record is defective in certain frequencies; a filter means electrically connected to said last named means for filtering the electric undulations varying with said complete range of sound frequencies to produce a band of frequencies within said complete range, which band includes said certain frequencies in which said first sound record is defective; and means for transmitting said band of frequencies to the other of said armatures to vibrate the other of said mirrors at frequencies



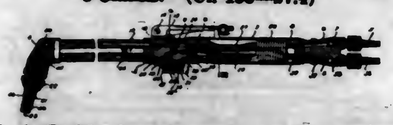
within this band, thereby forming a second sound record on said other section of said sound track which supplies the deficiences of said first sound record.

2,108,816
REFECTORY TABLE
Alfred H. Holland and Robert A. Holland, Winston-Salem, N. C.
Application November 19, 1934, Serial No. 753,716
1 Claim. (Cl. 311—56)



In a refectory table having a frame and a top secured to the top of the frame in spaced relation to the top of the frame and providing at each outer edge a space for the nesting of leaves, a pair of slides secured to the lower side of each leaf, and having sliding movement in the frame, the top edges of the frame having notches therein for reception of the slides, each slide comprising a piece of sheet metal bent to form a top and a pair of sides, the lower edge of one side portion being bent inwardly, a wedge-shaped block member mounted for sliding movement in each of said slides below the top thereof and between said sides, said wedge-shaped member having a groove in one side thereof into which the said inturned lower edge of one of said side portions is adapted to project, one of the side portions of each of said slides having a bracket secured to the inner surface thereof, a tension spring having one end secured to the bracket and having its other end secured to said block for normally urging said block between the slide and the frame when the leaves are extended, one of the sidewalls of each of said slides having a slot therein, a rod secured to said block and slidably penetrating said bracket and being bent laterally and penetrating said slot where its end can be engaged to push said block inwardly to permit lowering of the leaf.

2,108,817
MACHINE GUN
Filser D. Hoppert, William R. Bull, and Clarence E. Simpson, Springfield, Mass.
Application June 17, 1936, Serial No. 85,698
2 Claims. (Cl. 42—75)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



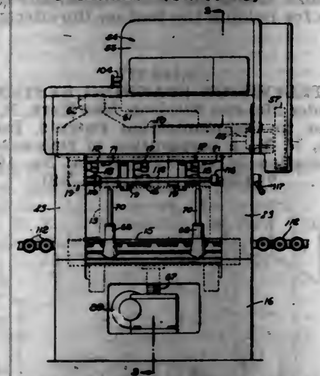
2. In a gun, a receiver, a jacket on the receiver having a barrel supporting member at its front end, a barrel having its breech end mounted in the receiver and its muzzle end passing through the front supporting member of the jacket, an adjusting nut threaded on the barrel and having means engaging the rear part of the front supporting member whereby said nut is restrained against rotational movement, and a locking nut on the barrel on the forward side of the front supporting member.

2,108,818
PRACTICE BOMB
Sargent P. Huff, Chevy Chase, Md., and Arthur Adelman, Cheesaning, Mich.
Application April 21, 1937, Serial No. 138,180
2 Claims. (Cl. 102—2)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A practice bomb including a body adapted to contain an inert material, a barrel on the rear of the body through which inert material is introduced into the body, a container housed in the barrel and having a flash tube, an expelling charge in the inner part of the container, a charge of powdered material in the remaining part of the container, a cartridge in the outer part of the flash tube, a firing pin tube on the container, a firing pin in said tube, an arming bolt interposed between the cartridge and firing pin and means for ejecting the arming bolt when the bomb is launched.

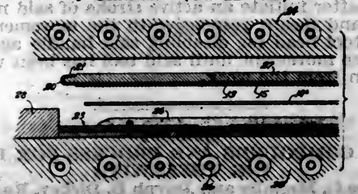
2,108,819
FLASHBACK-RESISTANT BLOWPIPE
Wilgot J. Jacobsson, Buffalo, N. Y., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
Application August 31, 1932, Serial No. 631,288
6 Claims. (Cl. 158—27.4)

1. A flashback resistant blowpipe adapted to utilize a combustion supporting gas and a combustible gas for producing a heating flame, said blowpipe comprising a mixer having a nozzle and an outlet throat therein; a burner nozzle; a conduit including said mixer throat for conducting the combustible gas mixture to said burner nozzle; a supply conduit for conducting a combustion supporting gas to said mixer nozzle; a supply conduit for conducting a combustible gas to said mixer; a portion of said supply conduit for combustion supporting gas connecting directly with said mixer nozzle and being elongated and having a minimum internal cross-sectional area substantially as large as the internal area of said mixer throat; said elongated portion being free from constrictions therein and having sufficient length and volume therein to receive the unburned backfiring combustible mixture and to retain said backfiring combustible



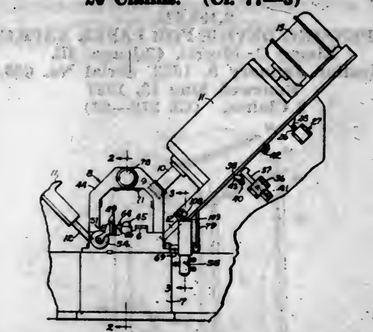
mixture therein until said mixture has been completely burned and until said combustible mixture conduit and any particles remaining therein have been cooled below the ignition temperature of said combustible mixture.

2,108,820
BLOWPIPE
Wilgot J. Jacobsson, Elizabeth, N. J., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
Application November 9, 1934, Serial No. 752,205
15 Claims. (Cl. 158—27.4)



4. In a blowpipe, the combination of a body comprising a tubular handle and blocks secured to and closing the front and rear ends of said handle; a valve in the front block; a stem entirely within said handle for operating said valve and slidably supported by both of said blocks; means carried by the rear block for actuating said stem to operate said valve; a fuel gas inlet conduit and an oxidizing gas inlet conduit, both within the rear block; and conduits extending through said handle and severally communicating with said inlet conduits; one of said communicating conduits within said handle comprising a coiled portion having adjacent coils in close proximity to each other; said stem and a portion of the other of said communicating conduits being surrounded by said coiled portion.

2,108,821
MACHINE TOOL
John R. Johnsen, Alexander Oberhoffken, and Ralph L. Cetta, Rockford, Ill., assignors to The Ingersoll Milling Machine Company, Rockford, Ill., a corporation of Illinois
Application October 2, 1934, Serial No. 746,652
5 Claims. (Cl. 77—3)

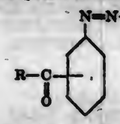


1. A machine tool for machining the bearing recesses of an engine block comprising, in combination, an abutment engageable with the crank case side of an engine block, a member engageable with the opposite side of said block and movable toward and away from the abutment to press said crank case side against the latter with a pressure insufficient to distort the block substantially, power actuated clamping means adapted to be rendered active after said block has approached said abutment and acting, when operated, to engage the crank case flange and clamp the block against said abutment with a pressure substantially greater than said first mentioned pressure but sufficient to hold the block firmly during machining of said recesses, and means for machining said recesses while the block is so clamped.

2,108,822
PRINTING PLATE AND FORMATION THEREOF
Wells A. Lippincott, Chicago, Ill.
Application November 11, 1935, Serial No. 49,186
7 Claims. (Cl. 41—25)

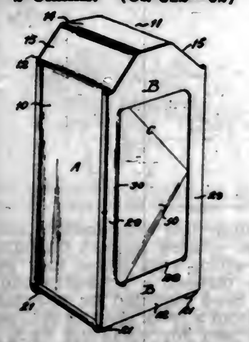
1. For use in multi-color printing on a printing press having cylindrical supports for the different color plates, a plurality of plates for printing different colors each comprising a flexible sheet of metal capable of withstanding edgewise compression and a layer of a thermoplastic resin, said layer being secured to one side of said sheet and having type formed therein, said sheets for the different color plates being disposed substantially equidistant from the type surfaces and operating to produce uniform distortion of said surfaces in bending of said plates to adapt them to the curvature of said supports.

2,108,823
MACHINE TOOL
Arthur H. Lyon, Rockford, Ill., assignor to The Ingersoll Milling Machine Company, Rockford, Ill., a corporation of Illinois
Application January 28, 1935, Serial No. 3,754
20 Claims. (Cl. 77—3)



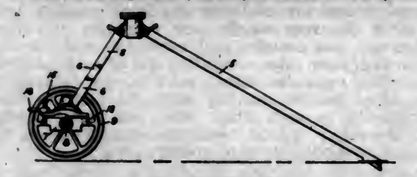
1. A machine tool organization comprising, in combination, a work support providing a slideway along which work pieces may be advanced successively through a predetermined operating position, a head mounted for movement toward and away from a work piece in said position and carrying a tool for operating upon the work, means by which a work piece may be clamped in said position, a member reciprocable longitudinally of the slideway and adapted during its active

stroke to move one work piece out of said position and advance the next work piece approximately into said position, individual power actuators for said head, said clamping means and said member, means movable into engagement with a work piece in said position to locate the work piece accurately on said support, a manually operable control handle operable upon movement in one direction to project said locating means into engagement with a work piece and thereafter initiate the operation of said actuators whereby to clamp the work, retract said member, and cause said head to be advanced into and then out of the work, said handle operating upon reverse movement first to retract said locating means out of engagement with the work and initiate operation of one actuator to unclamp the work, and thereafter initiate an active stroke of said member, and means responsive to the movement of said tool head for disabling said handle against reverse movement until said tool has been withdrawn from the work.



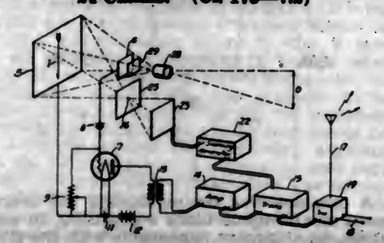
2,106,824
AZO COMPOUNDS AND PROCESS FOR DYEING THEREWITH
James G. McNally and Joseph B. Dickey, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application September 1, 1936, Serial No. 98,926
20 Claims. (Cl. 8—5)

3. A process for directly coloring an organic acid ester of cellulose which comprises applying thereto an aqueous suspension of an azo compound having the general formula:



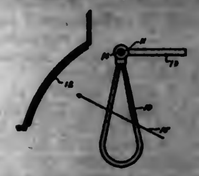
wherein R represents an alkyl group and R_1 represents a nuclear non-sulfonated aromatic coupling component.

2,106,825
DISPENSING DEVICE FOR PAPER NAPKINS
Elmer C. Morris, Chicago, Ill.
Application January 9, 1933, Serial No. 650,924
Renewed May 12, 1937
2 Claims. (Cl. 312—62)



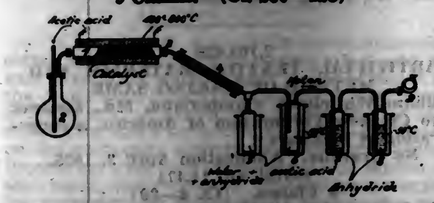
1. In a dispensing device for paper napkins, a container comprising two U-shaped members, with one of said members inverted and placed over the normal member to interspace the legs of said members to constitute the vertical side walls of the container, with the arch of the inverted member forming the top of the container and the arch of the normal member forming the bottom of the container, means securing the upper ends of the legs of the normal member in the arch of the inverted member, the legs of the inverted member having inwardly projecting flanges secured on the bottom of the container, the legs of said normal member having opposite apertures forming dispensing openings in opposite walls of the container with the openings spaced above the bottom of the container, opposite guides flared inwardly and upwardly from said flanges and extending between the container walls having the dispensing openings, and follower means mounted in the container and normally operating to move the napkins along the guides toward the dispensing openings.

2,106,826
MACHINE GUN CART
Sidney H. Negrette, New Orleans, La.
Application September 10, 1935, Serial No. 39,934
1 Claim. (Cl. 89—40)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



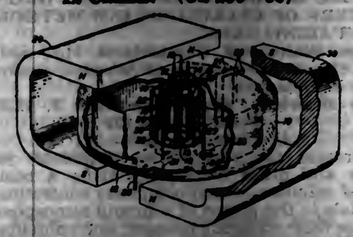
A tripod having a trail leg and a pair of front legs, each leg having a foot with a cleat, said front legs being divergently extended when the tripod is in normal erected firing position, a mobile unit for each front leg including a wheel and a horizontally disposed stirrup having a slot, the foot of a front leg resting on the stirrup with its cleat inserted in the slot of said stirrup, and a quick-detachable clamp on each horizontally disposed stirrup for holding the foot on the stirrup.

2,106,827
TELEVISION SCANNING SYSTEM
Alexander McLean Nicolson, New York, N. Y., assignor to Communication Patents, Inc., New York, N. Y., a corporation of Delaware
Application July 7, 1930, Serial No. 466,979
24 Claims. (Cl. 178—7.2)



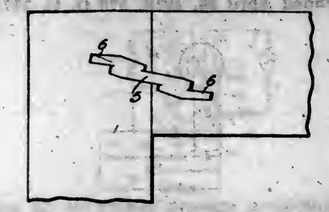
1. In a television system, a light sensitive device having a cathode, means for focusing an optical image of a scene to be transmitted on said cathode, and means for scanning with a ray of light said optical image while it is focused on said cathode.

2,106,828
ADVERTISING DEVICE
Frederick W. Quidas, New York, N. Y.
Application June 22, 1937, Serial No. 149,675
4 Claims. (Cl. 40—125)



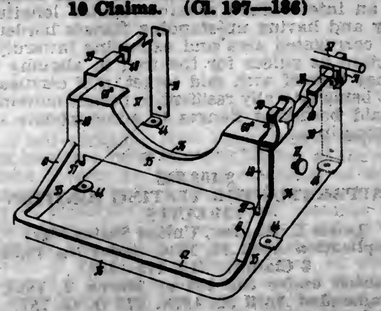
1. In combination with a hand strap of the type used in public conveyances; a frame secured at or near the upper end of the strap, substantially at right angles thereto, and transversely with the strap; and an advertising card inserted in said frame to be displayed from the bottom thereof.

2,106,829
PROCESS OF PRODUCING KETENE
Johann Sixt and Martin Magdan, Munich, Germany, assignors to Consortium für Elektrochemische Industrie, G. m. b. H., Munich, Germany, a corporation of Germany
Application September 6, 1934, Serial No. 742,888
In Germany September 16, 1933
9 Claims. (Cl. 260—123)



1. A catalytic process for the production of ketene, which comprises subjecting acetic acid vapors containing an acetic anhydride-forming catalyst which is gaseous at the reaction temperature, to heating at a temperature between 500° C.–900° C., conducting the heating at least under a partial vacuum whereby a mixture containing ketene, water, acetic acid and acetic anhydride is formed and immediately separating at least a part of the ketene from the other components.

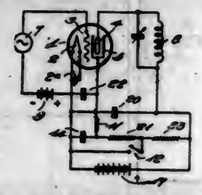
2,106,830
ELECTRON DISCHARGE APPARATUS
Albert M. Skellett, Madison, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application February 26, 1937, Serial No. 127,877
12 Claims. (Cl. 250—36)



1. Electron discharge apparatus comprising a cathode and an output electrode, said output electrode having a cylindrical electron receiving portion encompassing said cathode and defining an inductance, and having also spaced portions forming a capacitance in circuit with said inductance.

2,106,831
FASTENER
Kirby T. Snyder, Los Angeles, Calif.
Application May 17, 1935, Serial No. 22,071
1 Claim. (Cl. 85—11)

In a fastener, a body portion constructed of a strip of sheet metal material, the ends of the body portion being cut at oblique angles with respect to the side edges of the body portion providing end prongs, said body portion having slits extending inwardly from the side edges thereof at oblique angles with respect to the side edges, the slits of one side of the body portion being in direct line with corresponding slits at the opposite side thereof, the portions of the body portion separated from the body portion by the slits, extending laterally from the body portion, providing prongs, said prongs being arranged in staggered relation with respect to each other, the prongs at one half of the body portion being inclined at oblique angles with respect to the body portion, and the prongs at the other half of the body portion extending at oblique angles in a direction opposite to the first mentioned prongs, and the prongs at the ends of the body portion being longer than the remaining prongs.



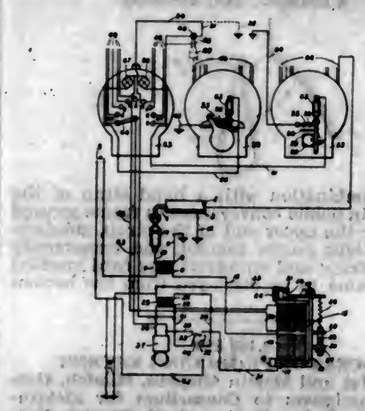
2,106,832
TYPEWRITING MACHINE
Burnham C. Stickney, Hillside, N. J., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware
Application October 18, 1933, Serial No. 694,041
10 Claims. (Cl. 197—136)

1. A standard typewriter internal main frame self-sustaining and inclusive of a forward open framing which hems the keyboard, and having a removable mask or outer frame struck up from sheet-metal and including side walls having corners and also having a joining member that extends forward therefrom to encase said open keyboard frame-portion, said main frame having

upright corners encased by the mask, said main frame having spread front shoulders rising above the mask for supporting a carriage-track.

2,106,233
TELEGRAPHIC KEYING CIRCUIT
James D. Wallace, Washington, D. C.
Application July 23, 1930, Serial No. 469,299
2 Claims. (Cl. 250—17)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a telegraphic keying system, an electron tube having a cathode, an anode, a control grid and a screen grid, an input circuit interconnecting said cathode and control grid, an output circuit interconnecting said cathode and anode, a keying circuit comprising a source of potential and three resistors connected in series between said screen grid and said cathode, a key connected to short-circuit one of said resistors and said source, and a condenser connected between said cathode and the terminal remote from said screen grid of the resistor nearest said screen grid.



2,106,234
STAND FOR CORDLESS ELECTRIC IRONS
John P. Walpole, Jackson Heights, N. Y.
Application October 11, 1935, Serial No. 44,982
5 Claims. (Cl. 219—25)

1. The combination of a pressing iron with a stand for supporting the iron, an electric socket carried by said stand, prongs connecting said iron electrically with said socket, said stand comprising an intermediate area corrugated longitudinally and having up-standing flanges bordering said corrugated area and extending inwardly to function as guides for the iron in aligning the prongs thereof with said socket, said corrugated area being laterally resilient to permit movement of said bordering flanges to accommodate said pressing iron.

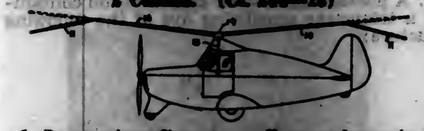
2,106,235
APPARATUS FOR TESTING IGNITION CIRCUITS
Lewis E. Wagner, United States Navy
Application April 23, 1936, Serial No. 76,602
6 Claims. (Cl. 175—183)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

6. A testing apparatus as described, comprising a high voltage transformer, a low voltage transformer; a relay including separable contact points, a first coil on said relay connected in series with the primary of the high voltage transformer to separate said points when current is drawn from the coacting secondary, said coil being connected in series with the primary of the low voltage transformer when the said points are open but shunted around the low voltage primary when the points are closed, a second coil on said relay connected across the secondary of the low

voltage transformer to retain said points separated when moved apart as aforesaid and an indicator operatively connected to the secondary of the low voltage transformer.

2,106,236
ARTIFICIAL TEXTILE MATERIAL AND METHOD OF MAKING SAME
William Whitehead, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application April 3, 1935, Serial No. 14,471
3 Claims. (Cl. 8—30)

1. Process for locally saponifying filaments, yarns, fabrics and like materials having a basis of organic ester of cellulose, which comprises removing from selected areas of the material a small proportion of its acidyl content by pretreatment with an alkaline saponifying agent, whereby the material wherever pretreated is rendered more sensitive to saponification, and subsequently completing the desired saponification of the pretreated areas by treating the material, while it still contains reaction products derived from the pretreatment, with an alkaline substance which is less alkaline than that employed in the pretreatment and which has substantially no saponifying action on the areas of the material which have not been pretreated.



2,106,237
TEXTILE MATERIAL CONTAINING ORGANIC ESTERS OF CELLULOSE AND METHOD OF PREPARING SAME
William Whitehead, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application April 3, 1935, Serial No. 14,472
12 Claims. (Cl. 8—30)

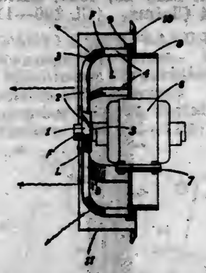
1. Process for saponifying filaments, yarns, fabrics and other materials having a basis of ester of cellulose, which comprises subjecting the materials to the action of a humid atmosphere to increase their moisture content, and subsequently saponifying the materials while they still possess a high moisture content.

2,106,238
ARTIFICIAL MATERIAL HAVING MODIFIED CHARACTERISTICS AND METHOD OF MAKING SAME
William Whitehead, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application April 3, 1935, Serial No. 14,473
4 Claims. (Cl. 8—30)

1. In a process for saponifying yarns, filaments, fabrics and like materials having a basis of a cellulose ester by treatment with an alkaline reagent, the step which comprises indicating changes in the pH value on the materials during the saponification by means of a coating applied to the materials, said coating containing a fugitive coloring pH indicator, whereby the extent or degree of saponification may be visibly ascertained.

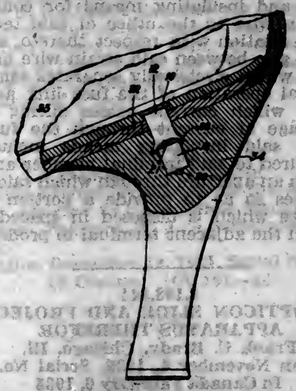
2,106,239
AIRCRAFT
Edward Burke Wilford, Marion, and Elliot Daland, Philadelphia, Pa.
Application January 2, 1936, Serial No. 206
2 Claims. (Cl. 244—16)

1. In an aircraft, a normally aerodynamically driven rotary wing system having a hub and an axis of rotation, a plurality of blades attached to the hub, each blade comprising a stationary inner section of appreciable length and of airfoil section, and a tip section oscillatably mounted on the stationary section for movement relative thereto, on axes both longitudinal and lateral of said blade, the respective tip sections arranged for movement to substantially nullify the moments from the forward velocity of the aircraft.



2,106,240
UNDERGROUND TRAP FOR LEAKING GAS
George E. Anthony, Detroit, Mich.
Application June 29, 1936, Serial No. 87,961
1 Claim. (Cl. 48—193)

In a device of the character described, the combination with a gas pipe traversing a wall, of a trap in proximity to such wall, formed with a chamber to entrap gas exteriorly following the pipe, and with an inlet to such chamber, artificial packing means interposed between the trap and wall, a collar secured on the pipe within the trap, positioning the trap in effective engagement with the packing, and a vent pipe extending from the trap to the surface of the ground.

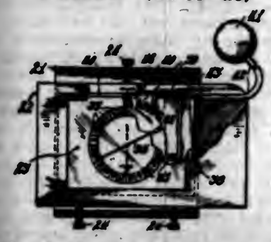


2,106,241
FAN
Albert L. Baker, Sacramento, Calif.
Application October 30, 1936, Serial No. 108,494
1 Claim. (Cl. 230—234)

A fan assembly comprising a hub, blades mounted on and initially radiating from the hub and formed with outer portions extending rearwardly relative to the flow of air past the fan, a ring concentric with the hub connecting the rear ends of said outer portions, a stationary band

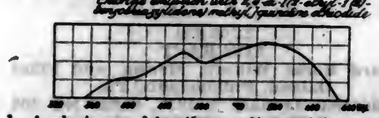
forming an air intake passage projecting rearwardly from the ring concentric therewith, the bores of the ring and band being substantially the same, and a flange on said band overhanging the peripheral edge of the ring.

2,106,242
SELF-CLINCHING RIVET
Lewis J. Bassett, Swampscott, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application June 5, 1936, Serial No. 83,725
2 Claims. (Cl. 85—40)



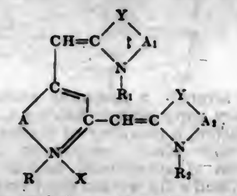
1. A self-clinching rivet comprising a tubular shank having a head end and having at the end opposite thereto an integral extension to serve as an anvil, the wall of said shank having a plurality of circumferentially spaced openings extending from said anvil toward the head end of the shank and which divide the shank into a plurality of longitudinal tongues each of which at one end is joined to the anvil and all of which at a locality between the anvil and the head end of the shank are joined to each other, the junction between the tongues and the anvil being considerably reduced in thickness by a deep V-shaped groove to provide frangible webs, one of the walls of said groove sloping outwardly and from the head end to direct the tongues outwardly when the webs are broken by force applied to the head end of the shank, thereby enabling said tongues to serve as prongs.

2,108,843
FUSE LINK
Eugene F. Boothe, St. Louis, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri
Application May 25, 1936, Serial No. 81,636
4 Claims. (Cl. 200—117)



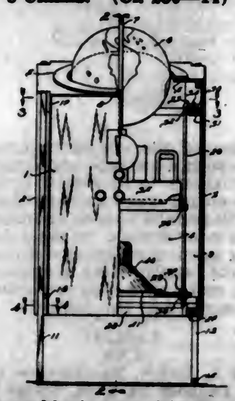
1. A fuse link assembly including a pair of spaced terminal members, a fusible element for electrically connecting said terminal members, and connecting means for mechanically connecting said terminal members so as to relieve said fusible element of tension applied to the fuse link assembly, said connecting means including a strain wire connected to one of said terminal members and insulating means for connecting said strain wire to the other of said terminals in spaced relation with respect thereto, so as to provide a gap between said strain wire and said terminal, which electrically separates same during normal operation of the fuse link assembly and over which current passes during abnormal passage of current through the fuse link assembly, said insulating means including a block secured to said terminal member and provided with an aperture through which said strain wire passes so as to provide a portion of the strain wire which is disposed in spaced alinement with the adjacent terminal to produce said gap.

2,108,844
STEREOPTICON SLIDE AND PROJECTION APPARATUS THEREFOR
Frank C. Brady, Chicago, Ill.
Application November 4, 1935, Serial No. 48,699
In Canada February 6, 1935
4 Claims. (Cl. 88—26)



1. A slide adapted to be held in a receptacle of a light ray projector, including spaced transparent plates having an air inlet and outlet therebetween, a fixed indicator associated with said plates, an opaque spinner pivotally mounted between said plates, vanes on said spinner, and a series of transparent indicating characters on said spinner all substantially equi-distant from its center of rotation and arranged to pass adjacent said fixed indicator as air is forced through the inlet against said vanes to rotate the spinner, whereby the operation of the spinner can be visibly projected upon a screen.

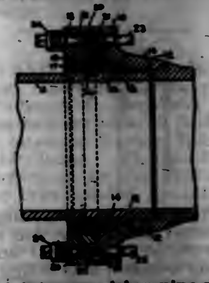
2,108,845
PHOTOGRAPHIC EMULSIONS CONTAINING TRINUCLEAR CYANINE DYES
Leslie G. S. Brooker and Lloyd A. Smith, Rochester, N. Y., assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
Application April 24, 1936, Serial No. 76,185
17 Claims. (Cl. 95—7)



1. A photographic silver salt emulsion containing a trinuclear sensitizing dye of the following structure:

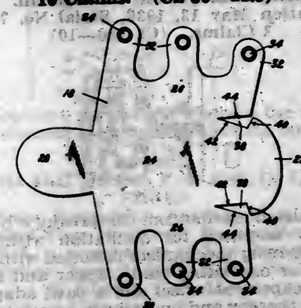
wherein A, A_1 and A_2 represent an organic residue selected from the group consisting of a vinylene, a phenylene and a naphthylene group, R, R_1 and R_2 represent an alkyl group, X represents an acid radical and Y represents an atom selected from the group consisting of oxygen, sulfur and selenium.

2,108,846
RADIO CABINET
Walter O. Brown, Detroit, Mich.
Application August 29, 1934, Serial No. 741,948
Renewed April 30, 1937
8 Claims. (Cl. 250—14)



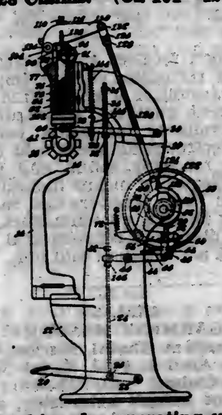
1. A radio cabinet comprising walls forming a hollow body having an opening at its lower end, said walls being formed of practically non-resonant material, a radio set including a loud speaker, means for supporting the same within the hollow body, comprising a non-resonant frame member secured to the walls of the hollow body, a series of vertically extending rods, the upper ends of which are bent to extend over the non-resonant frame member and the lower ends of which are unattached to the hollow body, a non-resonant element between the said ends of the rod and the said frame attached to the hollow body, said receiving set having portions adapted to receive the rods and on which the set is vertically adjustable, a loud speaker at the free lower ends of the rods, means for adjusting the speaker vertically on the rods, and a flexible connection between the speaker and the receiving set to permit relative adjustment of the set and speaker.

2,108,847
ELECTRIC LAMP BULB
Lyle E. Calkins and Ormonde S. Levi, Toledo, Ohio, assignors to Save Electric Corporation, Toledo, Ohio, a corporation of Ohio
Application April 8, 1937, Serial No. 135,736
4 Claims. (Cl. 176—16)



1. A glass electric lamp bulb having its interior surface frosted by chemical etching so that the maximum brightness of an ordinary incandescent lamp comprising such bulb will be less than 20% of that of a like lamp with a clear bulb, said interior bulb surface being characterized by the presence of acicular portions to such an extent that the strength to resist breakage by impact is greater than 13% of that of a like clear bulb.

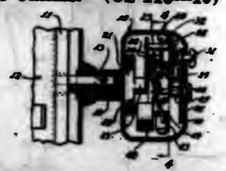
2,108,848
PIPE JOINT
Frank A. Engel and Franklin Hudson, Roselle, N. J., assignors to Inner-Tite Clamp Corporation, Elizabeth, N. J., a corporation of New Jersey
Application June 30, 1934, Serial No. 733,216
9 Claims. (Cl. 285—134)



1. A pipe joint comprising pipe sections having overlapped ends, a gasket, a gland encircling said gasket and abutting the end face of the overlapping pipe end, tapered apertures through said gland, means on said gland for holding said gasket in position, and means extending through said apertures and engaging one of the pipe sections for securing the gland.

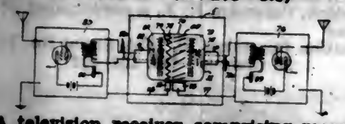
2,108,849
MANUFACTURE OF SANDALS
Karl Engel, Swampscott, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application September 24, 1936, Serial No. 102,348
10 Claims. (Cl. 36—11.5)

1. For use in the manufacture of sandals, a combination insole and upper blank comprising an insole portion and two upper portions formed as integral lateral extensions of said insole portion, said upper portions being partially separated from said insole portion by two notches located in the forepart of the blank, said notches being adapted to be closed and being shaped and arranged so that when closed said upper portions will be forced out of the plane of the rest of the blank to facilitate the shaping of said upper portions to the contour of a foot.



2,108,850
MARKING MACHINE
Otto Willy Fromm, Frankfort-on-the-Main, Germany, assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 19, 1934, Serial No. 758,160
28 Claims. (Cl. 101—42)

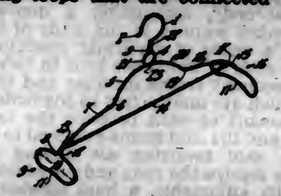
1. In a machine for operating upon shoes, a work support, an operating head mounted for



movement toward and away from said support, manually operated means for moving the head into engagement with a work piece on said support to measure the thickness of the work, and power-operated means for causing the head to press against the work, said means including members constructed and arranged to yield relatively to each other when a predetermined pressure of the head against the work has been set up.

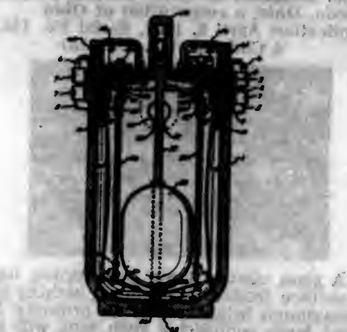
2,106,851
ALARM
Melissa B. Fulton, Chicago, Ill.
Application May 13, 1936, Serial No. 79,536
3 Claims. (Cl. 116—10)

1. An alarm mechanism, comprising a housing, a clapper mounted for oscillation within said housing, driving mechanism mounted within said housing for oscillating said clapper and including an escapement wheel and a pawl adapted to be driven thereby and operatively associated with said clapper, and a pendulum mounted in said housing having a pin extending substantially perpendicularly from a face thereof for normally contacting said clapper to prevent oscillation thereof, relative movement between said pendulum and the rest of said mechanism from normal position permitting oscillation of said clapper, and relative movement between said pendulum and the rest of said mechanism back to normal position resulting in said pin again preventing oscillation of said clapper.



2,106,852
TELEVISION APPARATUS
Joseph Gottinger, Chicago, Ill.
Application April 27, 1934, Serial No. 722,664
12 Claims. (Cl. 178—5.6)

1. A television receiver comprising means for receiving and recording current impulses from a television transmitter, a moving film for recording said current impulses, a scanning drum, a continuous conductor and spaced conductors on said drum, electrodes adjacent said drum, radio receivers for receiving sound and picture impulses, high frequency means inductively in circuit with said radio receivers and said continuous conductor and spaced conductors for passing an electrical discharge between said conductors and electrodes and through said film.



2,106,853
GARMENT HANGER
Elie Abraham Ghanal, Marion, S. C.
Application April 2, 1936, Serial No. 72,268
7 Claims. (Cl. 223—88)

1. A garment hanger comprising, a one-piece member having a supporting hook portion, a plurality of curved portions of different radii connected to the hook portion, a bar member, the opposite ends of which are formed into sleeve-supporting loops that are connected to two of

the curved portions, and means for retaining the parts in their operative positions by spiral coils in the bar and hook portion.

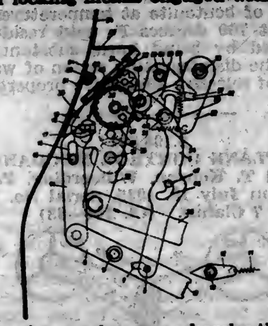
2,106,854
RETURN TRAP
Leonard D. Goff, Three Rivers, Mich.
Application June 22, 1934, Serial No. 732,623
29 Claims. (Cl. 127—103)

1. A return trap and the like comprising a casing, a float therein, a toggle primarily operable by said float, resilient means accelerating the operation of said toggle, condensate discharging means operated by said toggle, said means including a pressure steam valve, and means associated with said toggle for accelerating the operation of said valve.

2,106,855
EDUCATIONAL DEVICE
Louis D. Haffner, St. Louis, Mo.
Application March 1, 1937, Serial No. 128,886
6 Claims. (Cl. 40—73)

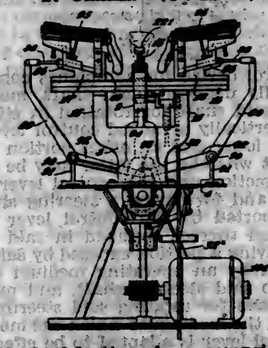
1. An educational device comprising a base, a standard, a bracket carried by said standard, a leaf, a fitting secured to said leaf and hingedly connected to said bracket, said fitting having an arcuate rack part concentric with the axis of said hinge connection, and detent means carried by said standard for cooperation with said rack.

2,106,856
ELECTRICAL CONNECTER
Walter A. Heinrich, St. Louis, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri
Application May 20, 1935, Serial No. 22,410
4 Claims. (Cl. 173—363)



1. An electrical connecter comprising a threaded body member having laterally spaced shank portions, a nut assembly normally threaded on said body member, and means for providing a connection between said nut assembly and said body portion when the nut assembly is unscrewed therefrom, said means including an extension projected from one of said shank portions, a member mounted on said extension for movement longitudinally thereof and adapted to engage said nut assembly when same is unscrewed from said shank portions in a manner to prevent disengagement of said nut assembly from said extension, and yieldable means for urging said member in one direction relative to said extension and permitting movement of said member in the opposite direction relative to said extension so as to increase the distance between the nut assembly and the threaded body portion in order to permit passage therebetween of conductors.

2,106,857
PROCESS FOR THE PRODUCTION OF ARTIFICIAL MASSES FROM VINYL ESTERS
Heinrich Hopff, Paul Garbsch, and Fritz Teller, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application December 11, 1930, Serial No. 501,664. In Germany December 23, 1929
9 Claims. (Cl. 260—2)

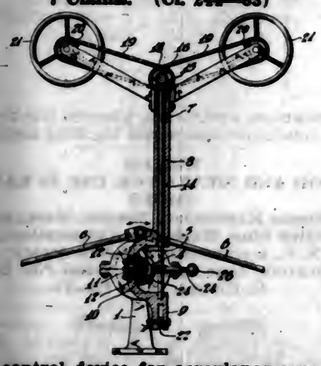


1. In the production of artificial masses by heat polymerization of vinyl esters, the step which comprises carrying out the reaction in the presence of a per-compound, capable of furnishing hydrogen peroxide on hydrolysis, and of an anhydride of a strong fatty acid, but in the absence of solvents and diluents, until the products of the reaction are insoluble in organic oxygenated solvents.

2,106,858
PRINTING AND RESETTING MECHANISM
Karl Imkamp, Bielefeld, Germany, assignor to Anker-Werke, A. G., Bielefeld, Germany
Application September 24, 1934, Serial No. 745,352
In Germany October 7, 1933
17 Claims. (Cl. 235—2)

1. In a machine of the class described, a totalizer, printing type carried by said totalizer, a zero-setting device for said totalizer, a driving mechanism for the machine, locking means for alternatively preventing operation of said zero-setting device or said driving mechanism, setting means for shifting said locking means, a support for a record sheet opposite said type, means controlled by said setting means for shifting said support relative to said type, blocking means to hold said locking means engaged with said driving mechanism, and means whereby the resetting of said totalizer releases said blocking means.

2,106,859
METHOD AND MEANS FOR USE IN LASTING SHOES
Jacob Simon Kamberian, Newton, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application June 3, 1935, Serial No. 25,626
17 Claims. (Cl. 12—7)



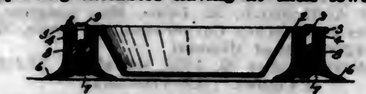
1. Method of lasting shoes comprising assembling an upper and insole upon a last, applying pressure to one side of the upper by means of a fluid medium throughout an area extending longitudinally of the upper near the top of the last, gripping the lower edge of that side of the upper and stretching it while causing said area progressively to advance toward the last bottom, then, while maintaining the application of said pressure, similarly applying pressure by means of a fluid medium to the opposite side of the upper throughout an area extending longitudinally near the top of the last, gripping the lower edge of that side of the upper and stretching it while causing said second-named area progressively to advance toward the last bottom, and thereafter wiping in the margins of the upper over the last bottom while increasing the pressure applied at the sides by said fluid medium.

2,106,860
METHOD OF AND SUBSTANCE FOR TREATING TOBACCO SMOKE
Harold L. Kaufman, Warren, Pa., assignor of one-half to Paul Bechtner, Chicago, Ill.
No Drawing. Application November 12, 1934, Serial No. 752,711
22 Claims. (Cl. 131—61)

22. An improved agent for the treatment of to-

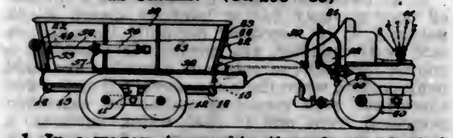
bacco smoke consisting of an intimate association of a medicament and the residue from the calcination of bentonite at temperatures ending above about 700 degrees F., said residue being characterized by being hard, substantially resistant to the disintegrating action of water and possessive of selective adsorptive properties.

2,108,861
AEROPLANE CONTROL MECHANISM
Cecil T. Kenyon, Wilmerding, Pa.
Application July 19, 1935, Serial No. 32,201
7 Claims. (Cl. 244—83)



4. A control device for aeroplanes comprising a horizontally disposed main shaft, means for supporting said shaft for rotation in either direction, a vertically arranged control lever having near its lower end an offset portion pivoted to said shaft whereby the latter may be rotated in either direction and the control lever moved backwardly and forwardly, a steering shaft rotatably supported by the control lever with a major portion thereof confined in said control lever and having a portion exposed by said offset portion whereby an operating medium may be connected to said steering shaft, and manually operable means for rotating said steering shaft and through the medium of which the movement of the control lever is adapted to be effected.

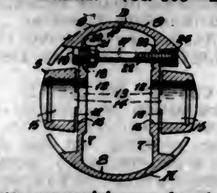
2,108,862
HALOGENATED THICK BOILING STARCH
Ralph Waldo Kerr, Riverside, Ill., assignor to International Patents Development Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application January 14, 1935, Serial No. 1,004
27 Claims. (Cl. 127—33)



26. Method of making a thick boiling, thick setting starch which comprises heating the starch in suspension in water at a temperature not substantially in excess of 75° F. with a halogen in a substantially pure state, and stopping the reaction while the starch is at a stage to be both thick boiling and also thick setting.

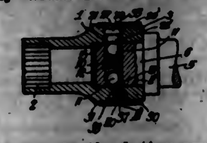
2,108,863
DISH
Abram T. Kieft, Grand Haven, Mich.
Application June 2, 1936, Serial No. 83,324
4 Claims. (Cl. 65—15)

4. In combination in a dish, a food container comprising a hollow dish portion having a radially extending flange integral therewith, a plurality of collapsible supporting members secured to said flange for supporting said dish portion, the said supporting members having at their lower extremity a suction chamber whereby the said supporting member is secured directly to a support by suction within the suction chamber.



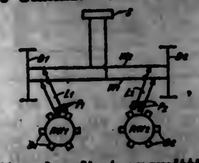
2,108,864
HYDRAULIC DOOR OPERATOR FOR WAGONS
Joseph Kuchar, Chicago, Ill., assignor to Athey Truss Wheel Co., Chicago, Ill., a corporation of Illinois
Application April 23, 1934, Serial No. 721,877
12 Claims. (Cl. 298—35)

1. In a wagon, in combination, doors adapted to open and close, liquid operated means adapted to actuate the doors in one direction, said doors being operated in the opposite direction by gravity, actuating mechanism for moving said liquid operated means to its initial actuating position independent of movement of the doors, latch means for holding said doors against operation by gravity when the liquid operated means is in said initial position, and means to release said latch means.



2,108,865
PISTON FOR INTERNAL COMBUSTION MOTORS
Elmer C. Long, Grosse Pointe Park, Mich.
Application June 10, 1935, Serial No. 25,751
17 Claims. (Cl. 309—13)

1. A piston comprising a head, a skirt, pin bosses, and walls joining said skirt and bosses, the joining of said walls with said bosses being in the diametral planes only of the inner ends of said bosses axially of the piston.

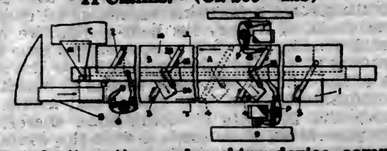


2,108,866
SOCKET WRENCH
Sigmund Mandl, Milwaukee, Wis., assignor to Blackhawk Mfg. Co., Milwaukee, Wis., a corporation of Wisconsin
Application April 17, 1936, Serial No. 74,881
7 Claims. (Cl. 287—119)

1. In combination, a socket having a shank receiving opening and a transverse opening, a shank adapted to be disposed in said socket and having a transverse opening adapted to be registered with the transverse opening in said socket, a member carried in one of said transverse openings and movable into the other to hold said shank and socket together, means for locking and unlocking the shank and socket including a shift ring movable on said socket and having an opening therein, and a part disposed in the outer end of said socket opening and adapted to be forced inwardly when said shift ring is moved

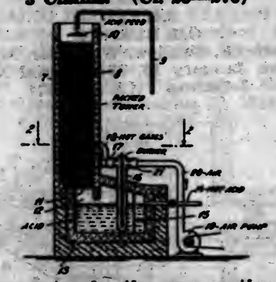
to carry the opening in the latter away from the transverse opening in said socket member, and a spring pressed member carried by said socket separately from said first member and engageable in a slot in said shift ring for retaining the latter in position on the socket.

2,108,867
RADIO DIRECTION SYSTEM
Gaston Adelin Mathieu, Shirehall Park, London, England, assignor to Radio Corporation of America, a corporation of Delaware
Application February 16, 1935, Serial No. 6,882
In Great Britain January 27, 1934
9 Claims. (Cl. 250—11)



1. A directional radio transmitting system having a plurality of energy radiating elements, means common to the radiating elements for energizing the same, and polarizing means for causing beams of energy simultaneously radiated from each of said elements to mutually interfere and neutralize one another along a plurality of sharply defined and substantially parallel zones intermediate between the axes of maximum field strength between said beams.

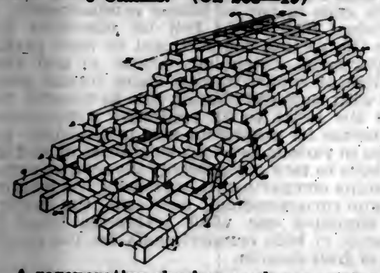
2,108,868
CHARIOT VEHICLE
John C. Rumsey, Lawrence, Kans., assignor to The Rumsey Junior Vehicle Company, Lawrence, Kans., a corporation of Kansas
Application October 28, 1935, Serial No. 47,105
5 Claims. (Cl. 280—1.16)



5. A vehicle of the character described comprising a frame provided with a propelling wheel, a pair of tread-operated springs provided with alternately operating drive connections to said propelling wheel, a figure simulating an animal carried by a moving portion of each of said springs, and an upright apron simulating a chariot shield carried by the rear portion of said frame and enclosing the space above the tread-operated portions of said springs.

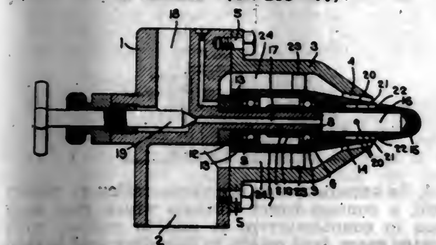
2,108,869
FRUIT SORTING AND PACKING SYSTEM
Ernest R. Sandmeyer, Yakima, Wash.
Application January 22, 1935, Serial No. 2,869
11 Claims. (Cl. 209—125)

1. A fruit sorting and packing device, comprising, in combination, a table, two oppositely moving belts, each of a width substantially half the width of said table, disposed on the table in edge-to-edge relationship, a plurality of partitions inclined relatively to the belts, including two fixed one at each end of the table, and intermediate partitions defining a sorting compartment and a plurality of packing compartments arranged in line, each intermediate partition defining the adjacent ends of two adjoining compartments, an individual distributing belt for conveying fruit from the sorting compartment to each packing compartment, extending parallel to and above the line of compartments, shunt means associated with each distributing belt to transfer fruit from the latter to its respective compartment, and means for positioning said intermediate partitions in various locations lengthwise of said first two belts to vary compensably the relative sizes of adjoining compartments, increasing the length of one and correspondingly decreasing the length of the adjoining one, while preserving intact the integrity of both compartments for the circulation of fruit therein.



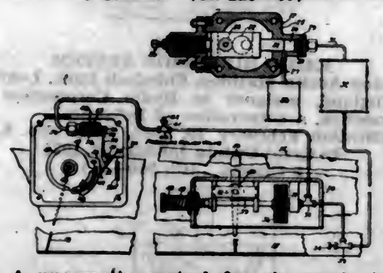
2,108,870
APPARATUS FOR THE RECOVERY OF SULPHURIC ACID
Howard W. Sheldon, Clarksboro, N. J., assignor to Socony-Vacuum Oil Company, Incorporated, New York, N. Y., a corporation of New York
Original application November 10, 1934, Serial No. 752,297. Divided and this application July 2, 1936, Serial No. 88,569
3 Claims. (Cl. 23—276)

1. In apparatus for the regeneration of sludge acid, a contact tower through which acid may pass in countercurrent to and in contact with heated gases, feed means to introduce acid to said contact tower, means to introduce heated gases to said tower at a point between its ends, thereby dividing said tower into a preheating zone above said gas inlet and a fume absorption zone below said inlet, means to control the temperature of said heating gases, an acid concentrating zone adapted to contain a body of acid, communication means between said absorption zone and said concentrating zone, sealing means to



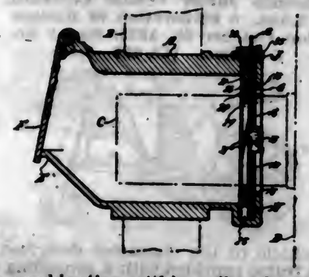
cover said concentrating zone to prevent access of air thereto and to compel gases therefrom to pass through said preheating zone, discharge means to remove concentrated acid from said concentrating zone heating means for said concentrating zone, comprising an elongated closed-ended vessel of impervious heat-conductive material depending into said concentrating zone and extending to a point substantially below the surface of the acid in said zone, means to maintain a combustion within said vessel, and means to remove the products of combustion therefrom while preventing their contact with the contents of said concentrating zone.

2,106,871
CHECKERWORK
Henry L. Smalley, Chicago, Ill., assignor to Harbison-Walker Refractories Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application May 26, 1937, Serial No. 144,907
9 Claims. (Cl. 262—19)



1. A regenerative checker-work comprising the combination of a plurality of courses formed from straights arranged in spaced parallel rows, intermediate courses of stretcher brick disposed between adjacent rows of said straights and forming therewith a plurality of vertical walls adjacent pairs of which cooperate to form separate flues, and straights extending between said parallel rows of straights for exposure to gases passing through said flues.

2,106,872
OIL BURNER
Charles E. Swallow, Worcester, Mass.
Application January 13, 1936, Serial No. 58,790
3 Claims. (Cl. 158—77)



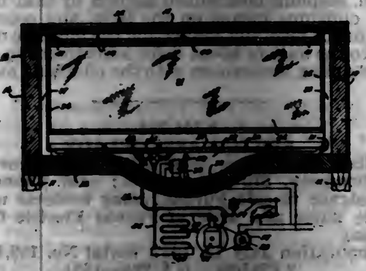
1. An oil burner comprising a housing having an air inlet and a nozzle portion provided with a discharge opening, a rotary nozzle member situated axially of said discharge opening and forming with the wall thereof an annular air delivery passage, said nozzle member having an interior chamber and a closed end projecting beyond the nozzle portion of the housing, vanes extending radially from the nozzle member and having inclined faces whereby the impact of the air passing through the housing against the vanes causes the nozzle member to rotate and produces a whirling motion in the air passing through the annular air delivery passage, and means for delivering oil to said interior chamber, said nozzle member being provided with an annular oil chamber open at one end on the exterior thereof at a point just beyond the nozzle portion of the housing, said nozzle member also being provided with communicating passages between said annular chamber and the interior chamber.

2,106,873
PNEUMATIC CONTROL FOR AIR SUPPLIED TO A STOKER
Lawrence R. Teeple, Portland, Oreg.
Application July 17, 1934, Serial No. 735,617
7 Claims. (Cl. 110—69)

1. A pneumatic control for air supply to a stoker consisting of an air duct having a pilot damper mounted therein whose position is responsive to the flow of air through said duct, a control damper within said duct for controlling the flow of air therethrough, a pneumatic actuator for said control damper, an air supply controlled by the operation of said stoker for operating said damper actuator, and a cam operated valve actuated by said pilot damper for controlling the pressure of air in said damper actuator.

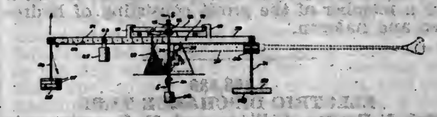
2,106,874
DUST GUARD FOR JOURNAL BOXES ON RAILROAD TRUCKS
Herbert C. Theiss, St. Louis, Mo.
Application June 13, 1936, Serial No. 85,046
3 Claims. (Cl. 286—6)

1. In combination with a railroad journal box and journal, the said box having a journal opening in its inner end to clear the journal and having a dust guard well inwardly of the said journal opening and this well opening out through the top of the box, a dust guard assembly including an inner liner mounted in the dust guard well and having an opening registering with the journal



opening, lugs turned inwardly from the said opening and engaging the margins of the journal opening, slotted ears extended from the liner up through the top opening into the dust guard well, an outer liner mounted in the dust guard well and spaced from the inner liner, this outer liner also having an opening registering with the journal opening, a sealing plate slidably mounted between the liners and having an opening to fit and engage the said journal, a cover plate having slots to fit down over the said ears on the inner liner whereby this cover will close the top opening into the dust guard well, and tapered split keys adapted to be driven through the slots in the said ears to press the cover plate down against the journal box.

2,106,875
EYEGLASSES
William R. Uhlemann, Evanston, Ill.
Application April 22, 1937, Serial No. 138,318
6 Claims. (Cl. 88—47)



1. A spectacle construction comprising a pair of lenses, a pair of channel-like straps embracing the edges of said lenses, respectively, at the nasal edge of the lenses, each of said straps including a lens-edge engaging portion, a bridge member for connecting said straps, and a pair of temple-supporting wire members each having an anchor anchorage portion extending therefrom and being secured directly to the lens-edge engaging portions of the strap and extending rearwardly and angularly therefrom and following the contour of the lens adjacent to and along the rear surface thereof for connection with the temple of the spectacle.

2,106,876
REFRIGERATING APPARATUS
Bernard J. Vanderen, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application January 23, 1936, Serial No. 3,121
2 Claims. (Cl. 62—89.5)

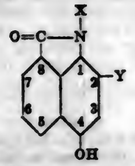
1. A refrigerating apparatus comprising in combination, a cabinet having a plurality of insulated walls forming a chamber therein, means cooperating with said walls to form a food storage compartment within said chamber, said means being constructed and arranged to extend continuously around at least four sides of said food compartment, said means providing a closed path for the flow of air around said compartment and having a portion thereof forming a support for food adapted to be stored in said compartment, a cooling element of a refrigerating system positioned in said chamber and isolated by said means from the interior of said compartment, and said cooling element extending along and lying against the food supporting portion of said means and being arranged in position to be traversed by air flowing around said compartment in said closed path of flow therefor.

2,106,877
TESTING DEVICE
William L. Wettlaufer, Buffalo, N. Y.
Application February 9, 1937, Serial No. 124,877
10 Claims. (Cl. 73—51)

1. A device for testing golf clubs including a beam, means for supporting said beam so that it may rock in two different planes, means for connecting a club to said beam so that when said beam is balanced said club is supported in a substantially horizontal position with the heel and toe of its head in substantially the same horizontal plane, whereby said club tends to cause said beam to rock in both of said planes and means for balancing said beam against the action of said club in both planes, whereby to obtain an indication of the values of certain of the factors which influence the character of the stroke of the club.

2,106,878
RADIO RECEIVING SYSTEM
George Maurice Wright, Chelmsford, England, assignor to Radio Corporation of America, a corporation of Delaware
Application August 23, 1935, Serial No. 37,464
In Great Britain August 20, 1934
4 Claims. (Cl. 250—20)

1. A modulated carrier wave homodyne receiver of the kind referred to, comprising a pair of separate receiving aerials which are substantially completely uncoupled from one another, means coupled to one of said aerials for deriving only the carrier energy for mixing with the received modulated energy for the homodyne action, and means coupled to the other of said aerials for deriving the modulated energy with which the carrier energy is to be mixed.



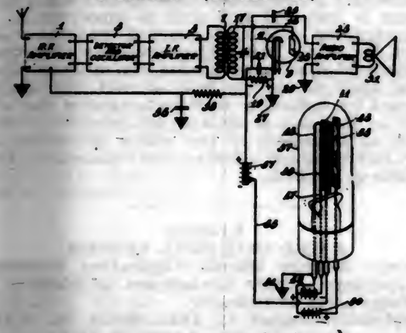
2,108,879
4-HYDROXYNAPHTHOSTYRILE COMPOUNDS

Werner Zerweck, Wilhelm Kunze, and Walter Brunner, Frankfort-on-the-Main-Fechenheim, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application August 12, 1936, Serial No. 95,618. In Germany August 14, 1935

3 Claims. (Cl. 260—124)

1. 4-hydroxynaphthostyrile compounds of the general formula:



wherein X stands for a member of the group consisting of hydrogen, alkyl, cycloalkyl and aryl of the benzene, diphenyl and naphthalene series, Y for a member of the group consisting of hydrogen and halogen.

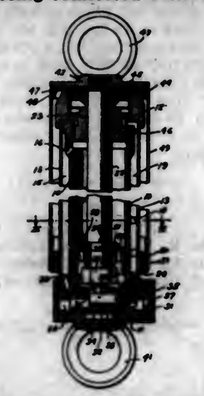
2,108,880
ELECTRIC DISCHARGE TUBE

Rene A. Braden, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application April 27, 1934, Serial No. 722,746

6 Claims. (Cl. 250—40)

1. An electric discharge tube comprising an elongated cathode adapted to emit electrons, an anode, a fluorescent material coating upon said anode and in the direct path of the emitted electrons, means for directing said electrons against said screen, and means for selectively preventing a portion of said cathode from supplying electrons which reach said screen.



2,108,881
HYDRAULIC SHOCK ABSORBER

Anthony B. Casper, Buffalo, N. Y., assignor to Houde Engineering Corporation, Buffalo, N. Y., a corporation of New York

Application March 15, 1937, Serial No. 130,848

7 Claims. (Cl. 188—88)

1. In a direct acting shock absorber, a cylinder structure, a piston structure comprising a piston and a rod extending therefrom to the exterior of the cylinder structure, a tubular wall surrounding the cylinder structure, means between said wall and cylinder structure extending longitudinally thereof and defining a reservoir space and a fluid flow channel, means defining a cross passage at the inner end of said cylinder, the inner end of said cross passage being connected with the inner end of said channel and the outer end of said channel being connected with the outer end

of the cylinder, and adjustable permanently open valve means in said cross passage for restricting the communication thereof with the inner end of the cylinder and for metering the flow of the fluid displaced from the outer end of said cylinder and through said channel during rebound movement of the vehicle springs with which the shock absorber is associated.

2,108,882
WIRE-STITCHING OR STAPLING MACHINE

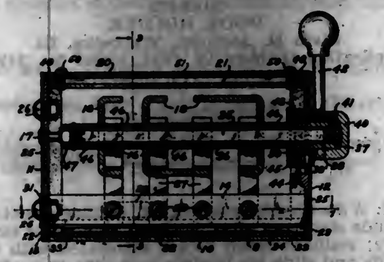
John F. Cavanagh, Providence, R. I., assignor to Boston Wire Stitcher Company, Portland, Maine, a corporation of Maine

Application April 7, 1932, Serial No. 603,787

13 Claims. (Cl. 1—3)

1. In a device of the type specified, the combination of a base, a member mounted on the base to adapt it to be moved toward and away therefrom, stapling mechanism carried by said member, clinching means on the base, and eccentric means for pivotally connecting the movable member to the base to adapt it for adjustment to aline the stapling mechanism with the clinching means.

2,108,883
SWITCH ASSEMBLAGE



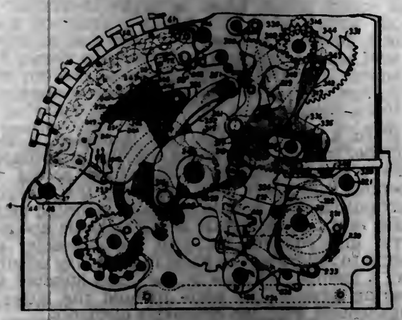
William C. Furnas, West Allis, and Sigurd R. Thompson, Milwaukee, Wis.; said Thompson assignor to said Furnas, doing business under the name and style of Furnas Electric Company

Application July 12, 1937, Serial No. 153,152

3 Claims. (Cl. 200—168)

1. A housing for switch mechanism or the like, comprising, a frame having a base and side

flanges and end walls formed integral with the base, said flanges and walls all extending in the same direction away from said base and the latter being disposed between the former, mechanism associated with said frame between said flanges and walls, a cover applicable to said frame over the edges of said end walls and having resilient opposite side portions biased outwardly for snug coaction with the internal surfaces of said flanges, a sealing strip secured with-



in each end of said cover and being compressible against the entire edge of the adjacent end wall when said cover is applied to said frame, and a sealing strip secured to said base in contact with the inner side of each of said flanges, all of said strips being inter-engageable to provide an uninterrupted seal and said cover side portions being formed to compress said base supported sealing strips when said cover is applied to said frame to enclose said mechanism.

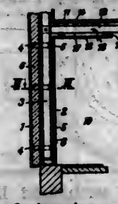
2,108,884
CASH REGISTER

Charles W. Green, Dayton, Ohio, assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland

Original application March 27, 1931, Serial No. 525,630. Divided and this application April 4, 1936, Serial No. 72,696

11 Claims. (Cl. 235—23)

7. In a machine of the class described, the combination of a series of keys; a differentially adjustable actuator controlled by said keys; an indicator; a driven member; means pivoted to said actuator and connected to said driven member for operating the latter under control of the actuator; minimum movement actuating means for said indicator, including an element carried by said driven member; and a plurality of members for operating said minimum movement actuating means to set the indicator directly from a previously set position to a new position under control of said driven member.



2,108,885
METALLIC WALL STRUCTURE

Franz Griebsch, Dessau, Germany, assignor to Therese Junkers, Gauting, near Munich, Germany

Application July 12, 1935, Serial No. 31,069

In Germany July 13, 1934

6 Claims. (Cl. 189—34)

1. Double-walled structure comprising an outer shell and an inner shell, both formed of sheet metal and arranged in spaced relation, structural supporting members enclosed between said two shells, insulating material of low heat conductivity covering the inner side of said outer shell but being spaced from said inner shell, which is uninsulated, the space between the walls being left free and the outer wall being impermeable to the flow of air, and members connecting said outer shell to said supporting members, said connecting members being formed to offer a considerable resistance to a heat flow by conduction from the supporting members to the outer shell, said inner shell being formed with perforations allowing the air adjoining the inner side of said inner shell to circulate between said inner and outer shells.

2,108,886
SULPHAMIC ACID SUBSTANCE

Fritz Guenther and Hermann Helsten, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application November 14, 1935, Serial No. 49,841. In Germany April 28, 1930

12 Claims. (Cl. 260—124)

1. A sulphamic acid substance derived by substitution of a $-SO_2X$ group, wherein X is a substituent selected from the group consisting of hydrogen and a salt-forming radicle, for a hydrogen atom in the amino group of an organic amine containing at least one aliphatic radicle with at least 8 carbon atoms.

2,108,887
SULPHAMIC ACID SUBSTANCE

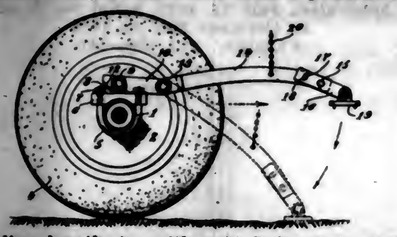
Fritz Guenther and Hermann Helsten, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application November 14, 1935, Serial No. 49,842. In Germany April 28, 1930

14 Claims. (Cl. 260—124)

1. A sulphamic acid substance derived by substitution of a $-SO_2X$ group, wherein X is a substituent selected from the group consisting of hydrogen and a salt-forming radicle, for a hydrogen atom in the amido group of an organic carboxylic acid amide containing at least one aliphatic radicle with at least 8 carbon atoms.

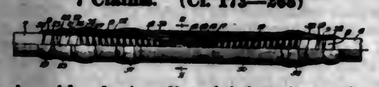
2,108,888
AUTOMOBILE LIFT



Howard H. Gunter, Baltimore, Md.

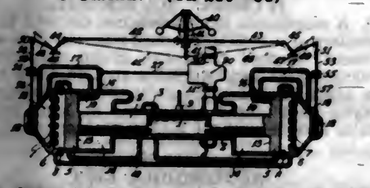
Application May 20, 1937, Serial No. 143,688

5 Claims. (Cl. 254—86)



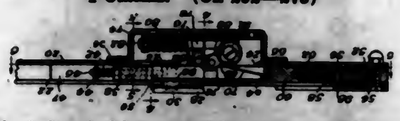
1. Means to elevate a wheel of a vehicle in response to movement of the vehicle comprising

support and stop members on a part of the vehicle running gear, a lifting member having a ground engaging end, a link connecting the other end of the lifting member with said support for vertical swinging movement from a position ex-



tending lengthwise with said link substantially horizontally in the path of vehicle travel, to a bowed position with said link, substantially vertical, lifting the vehicle wheel, passing the vertical position of thrust on the lifting member and engaging the stop member.

2,106,889
DUCT SPLICE FOR HIGH VOLTAGE CABLES
Herman Halperin, Chicago, Ill.
Application October 21, 1935, Serial No. 45,910
7 Claims. (Cl. 173—268)



1. A cable duct splice joining two adjacent lengths of lead sheathed electricity conducting cables adapted to be pulled into a cable duct having a diameter slightly in excess of that of the sheaths comprising, in combination, connector means joining the adjacent ends of the conductors in said cables, insulating means surrounding said connector means, and a rigid sleeve enclosing said insulating means and sealed at its ends to said lead sheathing of said cables and formed of a metal having a substantially higher unit tensile strength than that of the lead sheathing to withstand the stresses incident to pulling the spliced cables through the duct without substantially disturbing the insulating qualities of said insulating means enclosed thereby.

2,106,890
MOTOR COMPRESSOR OF THE FREE PISTON TYPE
Hermann Jänicke, Dessau (Anhalt), Germany, assignor to Therese Junkers, Gasting, near Munich, Germany
Application October 2, 1935, Serial No. 43,187
In Germany October 16, 1934
9 Claims. (Cl. 230—56)

1. A free piston motor compressor, in which the compressed air produced in the compressor serves as scavenging and charging air for the motor, comprising in combination, a motor cylinder, a compressor cylinder, a free piston in said motor cylinder and a free piston in said compressor cylinder, said pistons being rigidly connected with each other, means for conducting compressed gas from said compressor cylinder into said motor cylinder and means for varying the suction and delivery pressures in said compressor cylinder, while keeping the ratio of the two pressures approximately constant.

2,106,891
DOOR HOLDER
Elvin H. Johnson, Winnetka, Ill.
Application October 19, 1934, Serial No. 749,016
4 Claims. (Cl. 292—275)

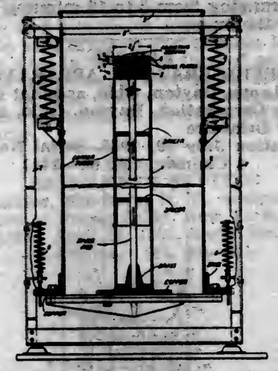
1. A door holder comprising: a guide structure; a slide structure slidable along said guide structure; resilient catch means associated with said guide and slide for holding said slide in a predetermined position; readily accessible manual adjustment means for preconditioning said catch means to be operative or inoperative; and manual adjustment means independent of said preconditioning means, for varying the effective tension of said catch means; said preconditioning means including a manual handle and preconditioning mechanism proper inside said guide structure, shaped to receive said handle when inserted from either one of two different outside positions.

2,106,892
INSIGNIA HOLDING BRACELET CLASP
Charles H. Kestenman, Providence, R. I., assignor to Kestenman Bros. Mfg. Co., Providence, R. I., a corporation of Rhode Island
Application January 2, 1936, Serial No. 57,238
13 Claims. (Cl. 40—140)

2. In a device of the type indicated, a clasp member having an opening therein, interchangeable character elements extending across the opening with their ends overlying the marginal portions thereof, a plate pivotally mounted on the clasp member, said plate being rockable about its pivot into engagement with the character elements to hold them in place in the clasp member, and a member slidable in the clasp member and bearing against the plate to hold the latter in engagement with the character elements.

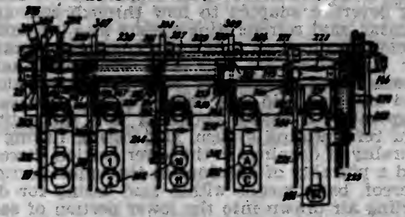
2,106,893
COMPOSITION OF MATTER AND METHOD OF MAKING THE SAME
Walter J. Kenig, Philadelphia, Pa., assignor to Sloane-Blabon Corporation, Philadelphia, Pa., a corporation of Delaware
No Drawing. Application December 22, 1934, Serial No. 758,284
7 Claims. (Cl. 260—2)

1. The method of hardening drying oil which comprises condensing a mixture at super-atmospheric temperature in which the condensation reactants consist of oxidized drying oil having double bonds in conjugate arrangement and a plurality of different cyclic organic compounds, said oil condensing with one of the cyclic organic compounds to form a condensation product, then adding a different cyclic organic compound and condensing the condensation product with the added cyclic organic compound, thereby producing a complex molecule and a tough durable mass.



2,106,894
SLIP CONSTRUCTION
Frank Kopp, Brooklyn, and Lewis Morris, Mount Vernon, N. Y.
Application April 7, 1937, Serial No. 135,427
1 Claim. (Cl. 2—73)

A form fitting lady's undergarment comprising a brassière section and a body section, said body section consisting of a front panel and a rear panel, said front panel having upwardly convergent edges, said brassière section consisting of a pair of breast panels of substantially rectangular outline, each secured to said front panel along said convergent edges so as to jointly define a V neck opening, a yoke member bordering the top edge of said rear panel and connecting said breast panels whereby a firm support for the bust will be provided and distortion prevented, means for uniformly tensioning said brassière section and the waist portion of said body section about the wearer, said means comprising a pair of elastic members each interconnecting all of said front and rear panels and said breast panels and said yoke member, said members being of elongated ovular shape tapering into points at the opposite ends merging with the seam interconnecting said front and rear panel adjacent the armpit and the waist respectively, and above and below said convergent edges, their widest portion being substantially between the seams connecting said rear panel and said yoke member and the seam connecting said convergent edges whereby the greatest degree of elasticity will be along said convergent edges and across the abdomen of the wearer.



2,106,895
FREQUENCY CONTROL TRANSMISSION LINE
Fred H. Kroger, Rocky Point, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application January 12, 1935, Serial No. 1,489
14 Claims. (Cl. 250—36)

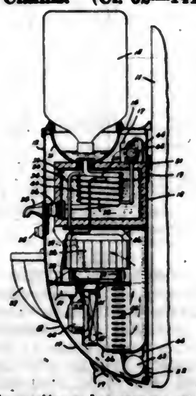
1. A tuned high frequency circuit comprising a concentric transmission line having inner and outer conductors, and means at one end of one of said conductors for maintaining the effective

length of said one conductor constant despite temperature fluctuations.

2,106,896
CASH REGISTER
Karl August Lehmann, Freudenstadt, and Ernst Breitling, Berlin-Tempelhof, Germany, assignors to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
Original application July 31, 1928, Serial No. 296,445. Divided and this application July 17, 1936, Serial No. 91,134. In Germany August 12, 1927
19 Claims. (Cl. 235—130)

1. In a machine of the class described, a main totalizer, a plurality of special totalizers, a setting lever adapted to determine the mode of operation of said main totalizer, a second setting lever adapted to determine the mode of operation of said special totalizers, a plurality of machine-releasing keys, a differentially actuated member co-operating therewith, pawls adapted to lock said setting levers, and connections between said locking pawls and said differential member for making said locking pawls operative and inoperative in dependence upon the adjustment of said differential member.

2,106,897
PROCESS OF MAKING FOOD PRODUCTS
Gaston J. Ley, John H. Payne, and George Akau, Honolulu, Territory of Hawaii, dedicated to the free use of the People of the United States
No Drawing. Application January 14, 1937, Serial No. 120,505
1 Claim. (Cl. 99—83)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



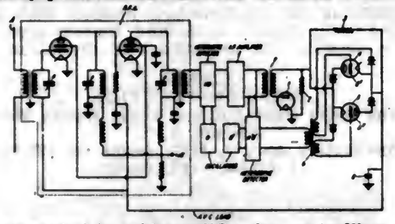
The method for producing taro meal so that it will not revert to an amorphous viscous mass when hot liquid is added, comprising subjecting dry taro meal to the action of heat at substantially 250° F. for approximately 30 minutes, thence raising the temperature to approximately

300° F. for approximately 15 minutes, thence raising the temperature to approximately 350° F. for a period ranging from 5 to 15 minutes, the while agitating the mass.

2,108,898
REFRIGERATING APPARATUS

Paul M. Lyons, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware

Application July 20, 1935, Serial No. 32,419
4 Claims. (Cl. 62—141)



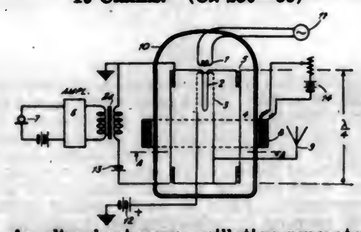
1. A portable unitary beverage cooling and dispensing apparatus comprising, a closed refrigerating system including an evaporator for cooling beverage adapted to flow through said apparatus, said refrigerating system also including a motor-compressor unit and a condenser, means for circulating air over said condenser, said means and said condenser being positioned below said unit and said unit being located below said evaporator, a casing enclosing and supporting said refrigerating system, said casing having a plurality of openings in the lower portion thereof and a plurality of openings in the upper portion thereof, baffle means within said casing for directing air drawn into the lower portion of said casing by said circulating means over said condenser and said unit, and means on said casing for removably suspending said apparatus from a wall of a room or the like.

2,108,899
AUTOMATIC VOLUME CONTROL

Harold Olaf Peterson, Riverhead, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application October 30, 1934, Serial No. 750,634
4 Claims. (Cl. 250—20)

1. In a receiving system, an amplifier in the path of the received signals, an oscillator and heterodyne detector in circuit with said path for producing audio frequency energy in accordance with the incoming signals, a rectifier also in circuit with said path for producing unidirectional current, a resistance connected across said rectifier through which said unidirectional current passes, an audio frequency transformer having a primary winding and two secondary windings, said primary winding being connected to the output of said heterodyne detector, two electron discharge devices each having an anode, cathode, and a control electrode, the cathode and control electrode of each device being individually connected to a secondary winding of said audio frequency transformer, a lead connecting the cathode of each device to the anode of its associated device, means for biasing the control electrodes of said devices to render the devices conducting only upon the presence of signal voltage in the secondary windings of said audio frequency transformer, a condenser one terminal of which is connected to a point of relatively fixed radio frequency potential and another terminal of which



is connected to said amplifier for controlling the gain thereof, a connection from said last terminal to one of the leads joining the cathode of one device and the anode of the other device, a connection extending between the other lead joining the anode of said one device and the cathode of said other device to a point on said resistance.

2,108,900
ULTRASHORT WAVE OSCILLATION GENERATOR CIRCUIT

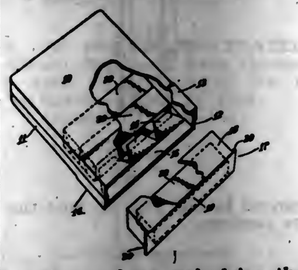
Harold Olaf Peterson, Riverhead, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application November 8, 1934, Serial No. 751,984
10 Claims. (Cl. 250—36)

1. An ultrashort wave oscillation generator circuit comprising a multi-electrode electron discharge device having within its envelope an oscillatory circuit in the form of a concentric transmission line having inner and outer conductors of a length equal to a multiple of one-quarter of the length of the operating wave, said conductors comprising electrodes of said devices, said inner conductor comprising a perforated grid over at least a portion of its length, said outer conductor having that part of its inside portion opposite the perforated grid coated with an electron emissive material, a source of energy for heating said electron emissive material for liberating electrons, means for applying suitable polarizing potentials to the electrodes of said device, and a utilization circuit coupled to said inner conductor.

2,108,901
PRODUCTION OF ASSISTANTS FOR THE TEXTILE AND RELATED INDUSTRIES

Mathias Pier, Heidelberg, and Bruno Engel, Mannheim, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany



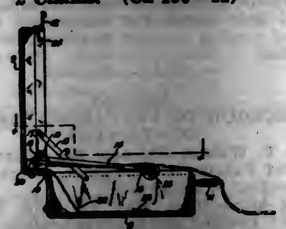
No Drawing. Application May 21, 1935, Serial No. 22,584. In Germany May 30, 1934
6 Claims. (Cl. 260—159)

1. A process for the manufacture of assistants for the textile and related industries which comprises sulphonating at temperatures of between about 10° and about 200° C. a product boiling above 200° C. and obtained by hydrogenating a material selected from the group consisting of mineral coals and mineral coal tars.

2,108,902
DISPENSING PACKAGE

Charles H. Rasmussen, Brooklyn, N. Y., assignor to Ferdinand Gutmann & Co., Brooklyn, N. Y., a corporation of New York

Application September 14, 1935, Serial No. 40,592
8 Claims. (Cl. 206—56)



1. A dispensing package embodying therein a box body having closed top, bottom, one end and two side walls, and a discharge opening opposite said end wall and defined by said top and bottom and said two side walls, a resilient check member extending across said opening from side wall to side wall, one edge of said check member being secured to the top or bottom wall of said body adjacent the edge of said discharge opening and projecting inwardly of said box body and toward the bottom or top wall thereof, and an inside slip cover having a deep flange substantially co-terminous with the free edge of said check member, the flange of said cover being adapted to enter said body through said discharge opening and depress said check member, whereby when the cover is applied to the box, an article may pass said check member and enter said cover so as to be removable therewith, and when said cover is removed, said check member will rise and prevent an article passing through said discharge opening.

2,108,903
LUGGAGE CASE

Julius Ritter, Jr. and Syevirous Essmus, Racine, Wis., assignors to Hartmann Trunk Company, Racine, Wis., a corporation of Wisconsin

Application March 16, 1936, Serial No. 69,053
2 Claims. (Cl. 190—41)

1. A luggage case, comprising a pair of hingedly connected sections, a garment supporting frame pivotally mounted in one of said sections and swingable from one position to another position at substantially a right angle to the first position, brackets fixedly carried by said one section and located adjacent the pivot of the frame and having fixed slotted arms extending at all times at an angle substantially bisecting the angle traversed by the frame in moving from one limit to the other, and a garment engaging bar mounted directly in said brackets and slidable lengthwise along the slots in the arms thereof and directly therein during swinging movements of the frame when the bar and frame are cooperating in the folding and confining of garments engaging both of the same.

2,108,904
REVERSIBLE SETTING

Louis Shakter, Brooklyn, N. Y., assignor of fifty percent to Frank Zoldo, New York, N. Y.

Application April 12, 1937, Serial No. 136,310
4 Claims. (Cl. 63—31)

1. A reversible setting for jewelry and the like, comprising a base having an opening therein, a setting pivotally mounted in said opening, and a latch slidably mounted on the under-side of the base and at one side of the opening, and adapted to extend into a recess in one side of the setting with one face thereof exposed, and also into a recess in the opposite side of the setting with the position of the setting reversed; characterised in that the setting is formed with oppositely positioned recesses spaced at right angles, with two of said recesses adapted to receive pins upon which the setting is rotatably mounted, and with the other two of said recesses adapted to receive the latch, with the setting turned in such a position that said recesses register with the latch.

2,108,905
METALLIC ATTACHMENT

Harry Sheer, Brooklyn, N. Y.

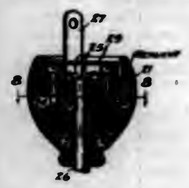
Application December 24, 1935, Serial No. 55,973
1 Claim. (Cl. 24—226)

In a clasp comprising a base portion made of celluloid and a coupling element secured to one of the ends of said base portion, means adhered to said base portion for anchoring the loop of a belt to said base portion, said means comprising a longitudinal flat metal strip terminating at each of its ends in a flat tab offset from and parallel to said main body member; a celluloid facing covering the outside surface of each of said tabs and adhered to said base portion; and a plurality of prongs struck out of each of said tabs and extending into the celluloid facing immediately adjacent thereto for attaching said celluloid facings to said tabs.

2,108,906
CAPSULE FILLING MACHINE

Stephen J. Speckhart, Maplewood, and Rudolph Herger, Irvington, N. J.

Application July 21, 1937, Serial No. 154,744
14 Claims. (Cl. 226—41)



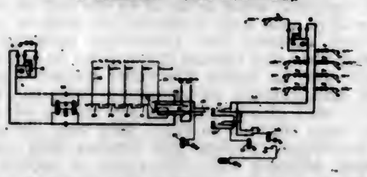
1. In a capsule filling machine, the combination of a power driven conveyor comprising a

series of lower flight members being interconnected into an endless chain, each lower flight member having positioned thereon an upper flight member which is adapted to be moved transversely thereof, an upper die attached to the upper flight member and a lower die attached to the lower flight member, said dies being normally in superimposed alignment, a receptacle for promiscuously receiving empty assembled capsules and segregating them into columns where-

by they may be fed to the superimposed dies of the endless conveyor, means for separating the two portions of the assembled capsules when in the dies, a hopper for feeding a powdered substance into the lower separated portions of the capsules, and means for lifting the filled lower portions of the capsules into engagement with the corresponding upper portions of the capsules so as to effect complete capsules having predetermined amounts of powdered substance therein.

2,108,907
ATTACHMENT PLUG
Edmund J. Te Pas, Rocky River, Ohio, assignor to Walter A. Frantz, Cleveland Heights, Ohio
Application August 8, 1933, Serial No. 684,192
6 Claims. (Cl. 173—323)

1. An attachment plug cap for use in connection with a flexible electric cord having conductor strands comprising a body formed from a soft rubber-like material having a central passageway for the reception of the cord, a relatively rigid member embedded in said body and a second relatively rigid member spaced therefrom, contact blades carried by said last named member, and means engaging said embedded member for connecting the conductor strands to said blades and for drawing said rigid members together whereby the relatively soft material of the plug cap therebetween is compressed about the end portion of the cord for securely anchoring the plug cap thereto.



2,108,908
VAPORIZING GENERATOR
Boyd W. Tullis, Wichita, Kans.
Application August 21, 1935, Serial No. 37,170
1 Claim. (Cl. 158—53)

A device of the class described comprising a valve body having a tip orifice and a valve seat in the rear of the tip orifice, a valve guide connected to the valve body, a valve stem in the guide in threaded engagement with the valve body having a valve to engage the seat and a fuel vaporizing retort having at one end an outlet communicating with the valve body and means for removably connecting the retort to the valve body, said means comprising a yoke and a set

screw carried by the yoke to hold the retort in operative position.

2,108,909
TELEPHONE SYSTEM
William J. Vincent, Rochester, N. Y., assignor to Rochester Telephone Corporation, Rochester, N. Y., a corporation of New York
Application May 28, 1936, Serial No. 82,284
2 Claims. (Cl. 179—84)

1. In a telephone system, a telephone line having a plurality of substations connected thereto, a ringer at each substation, each of certain of said ringers being connected between one side of the line and ground through a gaseous tube and through a condenser in series therewith, each of the remainder of said ringers being connected between the other side of the line and ground through a gaseous tube and through a condenser in series therewith, a link circuit connectible to said telephone line, a plurality of sources of ringing current of different characteristics equal in number to the maximum number of ringers connected to one side of said line, and means including said link circuit for connecting a selected source of ringing current to either of said sides of the line.

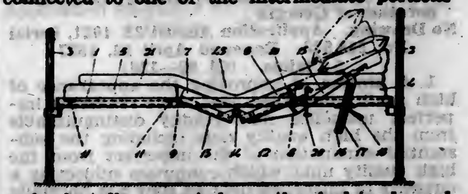
2,108,910
METHOD OF PREPARING FIBER CONTAINERS
Charles T. Walter, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
Original application May 29, 1936, Serial No. 82,435. Divided and this application November 21, 1936, Serial No. 112,066. In Canada July 25, 1936
3 Claims. (Cl. 93—36.5)

3. The method of treating fiber containers provided with marginal end rolls which comprises

applying to the marginal end rolls, a congealable thermo-plastic compound hard and elastic at

temperatures approximately 185° F. and below and hardening the compound.

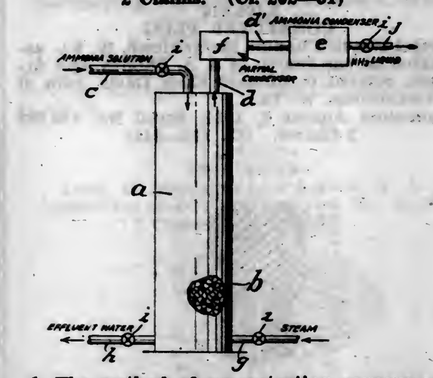
2,108,911
FOUNTAIN PEN FOR CONCENTRATED INK
Eugen Wetzel, Baltingen, Baden, Germany
Application April 12, 1937, Serial No. 136,592
In Germany April 17, 1936
7 Claims. (Cl. 120—42)



1. An improved fountain pen with a container for concentrated ink, coloring matter or the like, comprising in combination a tubular ink container, an extension piece screwed on the lower end of this container, a pen in this extension piece, a piston in the top of the said ink container, a discharge valve in said piston and a closing flap of rubber on said valve, a ring on the upper end of said ink container, an externally screw threaded extension at the top end of said ring, a container for concentrated coloring matter inserted in the extension of said ring, a piston in the upper end of said upper container, a rod downwardly extending from said piston and connected with said closing flap, a screw threaded rod upwardly extending from said piston in said upper container, a fixing nut screwed on this rod, a cap screwed on the top end of said screw bolt and an abutment nut under said cap.

2,108,912
DEFOAMING METHOD AND MEANS
Harland H. Young, Jr., Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Application July 9, 1935, Serial No. 30,577
5 Claims. (Cl. 252—8)

3. A defoamer comprising wax, aluminum stearate and stearic acid.

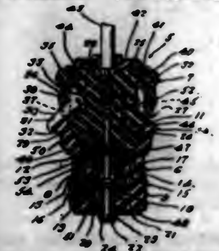


2,108,913
HOSPITAL BED OR THE LIKE
Johannes Adolf Bäwer, Gothenburg, Sweden
Application March 28, 1935, Serial No. 13,539
In Sweden March 29, 1934
4 Claims. (Cl. 5—66)

4. A hospital bed comprising a bedstead, a bed bottom resting upon the bedstead and divided into a head end portion, a foot end portion, and two lowerable intermediate portions pivotally connected to each other and to the end portions, one of the end portions being slidable in its longitudinal direction, an operating device connected to one of the intermediate portions

and pivotally mounted on the bedstead, and adapted to swing the intermediate portions downwardly, so as to make accessible a part of a patient resting on the bed, while only a comparatively unimportant movement of the slidable end portion in its longitudinal direction is caused.

2,108,914
METHOD OF CONCENTRATING AQUEOUS AMMONIA SOLUTIONS
James L. Bennett, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
Application May 1, 1935, Serial No. 19,192
2 Claims. (Cl. 202—51)

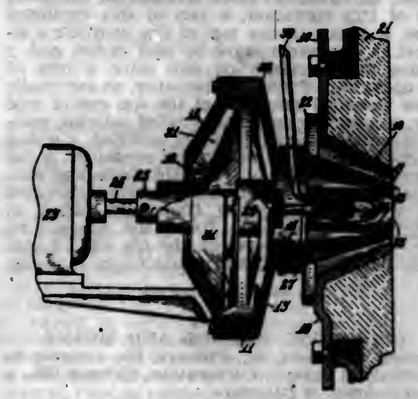


1. The method of concentrating aqueous ammonia solutions which includes continuously introducing a relatively dilute aqueous ammonia solution under pressure into the upper portion of a tower, introducing steam under pressure into the lower portion of the tower and in direct contact with said aqueous ammonia solution, whereby the aqueous ammonia solution and the steam pass in countercurrent flow through the tower, passing said aqueous ammonia solution and said steam through said tower at such a rate that substantially all of the ammonia is stripped from the solution before the solution reaches the lower portion of the tower, withdrawing the stripped solution from the lower portion of the tower, withdrawing ammonia gas and water vapor from the upper portion of the tower, passing the ammonia gas and water vapor into a condenser and therein condensing said ammonia gas and water vapor to produce a concentrated aqueous ammonia solution, while continuously maintaining a pressure in the tower and condenser which is above about 82 lbs./sq. inch absolute and thereby producing a concentrated aqueous ammonia solution containing more than 58% ammonia in the condenser, and withdrawing said concentrated aqueous ammonia solution from the condenser.

2,108,915
PROCESS OF TREATING NUTS
William Potter Bullard, Albany, and James Samuel Guy, Atlanta, Ga., assignors to National Pecan Growers Exchange, Albany, Ga., a corporation of Georgia
No Drawing. Application August 22, 1931, Serial No. 558,826. Renewed April 24, 1937
5 Claims. (Cl. 99—126)

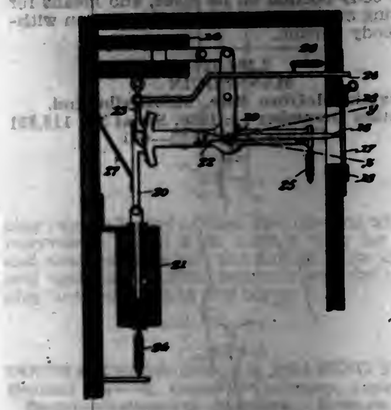
1. A process of improving the appearance of high quality unshelled nuts while rendering imperfect unshelled nuts readily distinguishable from the high quality nuts including the substantial elimination of the imperfect from the high quality nuts, which comprises subjecting a quantity of unshelled nuts as they are normally handled in bulk to a bleaching treatment, to thereby render the shells lighter than the natural color thereof, and thereafter subjecting the bleached nuts to such dyeing treatment that upon the washing and drying of the same the sound nuts will be evenly colored while imperfect nuts will present color characteristics which readily distinguish them from the sound nuts, and separating the imperfect nuts from the sound nuts, whereby substantially all imperfect nuts may be eliminated from the bulk before the unshelled nuts are distributed and the sound nuts are enhanced in appearance.

2,108,916
CONNECTER PLUG
Hershel Wayne Chaplin, Morgantown, W. Va., assignor of one-fourth to S. A. Phillips, and fifteen percent to Richard Earle Davis, both of Morgantown, W. Va.
Application August 7, 1934, Serial No. 738,862
3 Claims. (Cl. 173—343)



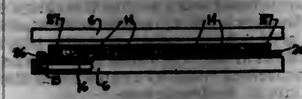
1. A plug connecter comprising two dielectric separable bodies, one of said bodies having an annular retaining portion, latches pivoted on one of said bodies and engageable with said annular retaining portion, a sleeve mounted for longitudinal movement on said one body, said sleeve being movable to an axial position to engage with a first portion of said latches in a manner to hold the latches engaged with said annular retaining portion, said sleeve being movable to an opposite axial position to engage with a second portion of said latches in a manner to hold said latches disengaged from said annular retaining portion so as to enable separation of said bodies, one of said bodies having a centralized stationary contact and the remaining body having an axial spring pressed contact engageable with said centralized stationary contact, first annular contact means on said remaining body and second annular contact means on said one body arranged to be in engaged positions while said bodies are connected together, and a dielectric tubular member spaced radially inwardly from the first and second annular contact means and surrounding said spring contact whereby said axial spring pressed contact is positively prevented from becoming engaged with either of said annular contact means at any time.

2,108,917
BUTTON FORMER
Flint C. Kider, Cleveland Heights, Ohio
Application February 11, 1937, Serial No. 125,323
5 Claims. (Cl. 140—13)



1. A button or knot former for wire fence machines including a body-member, at least one pin carried by and extending from said body-member, a collar carried by said pin and loosely held against said body-member, said collar having an outer surface that tapers inwardly toward said body-member, and bearings rotatively mounting said collar on said pin.

2,108,918
LIQUID FUEL BURNER
William F. Falkenberg, Chicago, Ill.
Application September 17, 1936, Serial No. 101,218
2 Claims. (Cl. 158—77)



1. A liquid fuel burner including an air nozzle and a rotatable shaft extending therein, a fuel atomizing nozzle mounted axially within said air nozzle on said shaft, said fuel nozzle comprising a cup having an internal coned fuel discharge surface and an end wall, a flange extending outwardly from said wall around but spaced from said shaft to provide a fuel receiving chamber, means feeding fuel to said receiving chamber, said wall having a plurality of inclined passageways extending therethrough, and the surrounded shaft portion and the inner surface of said flange each having serrations therein to reduce the fuel to fine particles prior to its being carried through said passageways into said cup.

2,108,919
TARGET INDICATOR
Cezar Grigoriu, Bucharest, Rumania
Application July 28, 1934, Serial No. 736,583
In Rumania July 27, 1933
3 Claims. (Cl. 236—67.5)

1. In a device for recording the hits on a target, having a frame for supporting a record strip, the combination of a group of punching pins arranged to pierce the record strip for recording the horizontal co-ordinates of parts of the target, with electro-magnets for operating said punching pins, a second group of punching pins arranged to pierce the record strip for recording the vertical co-ordinates of the said points, a second group of electro-magnets for operating the second group of punching pins, circuit-closing devices on the target arranged thereon for actuation by impacts of a projectile on the target, each of said circuit-closing devices being included in a separate circuit containing one electro-magnet of each group, so that on a projectile striking the target and actuating one of said circuit-closing devices, the record strip will be pierced by a punching pin representing a horizontal co-ordinate and a punching pin representing a vertical co-ordinate, displaceable supporting means for each group of punching pins, and means operative concurrently with any of said electro-magnets for displacing said supporting means a predetermined distance.

2,108,920
MEANS FOR INDURATING LUMBER
Walter D. Humiston, Flushing, N. Y.
Application May 3, 1935, Serial No. 19,674
3 Claims. (Cl. 144—281)

1. In a machine for indurating lumber, in combination a plurality of movable plates between which layers of lumber planks are compressed to a predetermined thickness, and compressible anti-spreader strips having a density greater than the density of the wood to be compressed between the plates and in contact with the outer edges of the outer planks of each layer for preventing the spreading of the lumber.

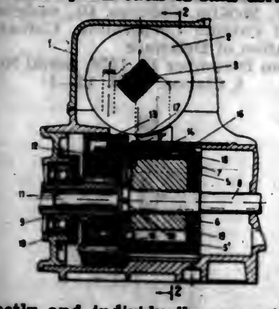
2,108,921
PIZZLE REMOVAL METHOD
Charles F. McKim, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
Application December 16, 1936, Serial No. 116,006
4 Claims. (Cl. 17—1)

4. In dressing animal carcasses, the steps involving the removal of the pizzle which comprise coring out the base portion of the pizzle.

2,108,922
STABILIZATION OF OIL
Virgil C. Mehlenbacher, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Application November 5, 1936, Serial No. 109,369
5 Claims. (Cl. 99—163)

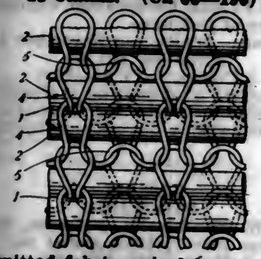
1. The method of stabilizing shortening which comprises adding thereto and thoroughly incorporating therewith a quantity of hydrogenated kapok oil.

2,108,923
STOCKING
Louis H. Mendelsohn, Paterson, N. J.
Application July 2, 1936, Serial No. 88,604
1 Claim. (Cl. 66—187)



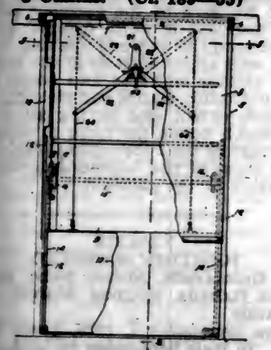
The herein described full-fashioned foot garment having all that segment thereof which is approximately coincident in width with the herein defined toe-zone of the garment and which, when the garment is worn, extends across and over and around the wearer's toes and terminates at both its ends approximately at the longitudinal seam-line knitted reticular and being also substantially uniformly elastic and yielding throughout its whole extent and having all of its yarn elements which define the holes in said segment more resistant to wear throughout said whole extent than those of the adjoining herein defined major portion of the garment.

2,108,924
IGNITION MAGNETO
Umberto Quintavalle, Milan, Italy, assignor to Fabbrica Italiana Magneti Marelli Soc. An., Milan, Italy
Application September 1, 1936, Serial No. 98,985
In Italy September 20, 1935
7 Claims. (Cl. 171—209)



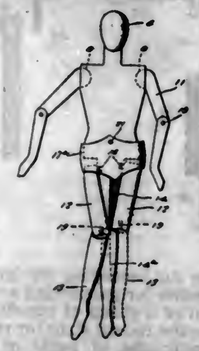
3. In an ignition magneto, a rotary element comprising a driving member, a disc-shaped part

connected with said driving member and a plurality of driven parts each of said driven parts



being directly and individually connected with said disc-shaped part.

2,106,925
KNITTED FABRIC AND THE PRODUCTION THEREOF
Harry Avery Raynor, Nottingham, England
Application February 14, 1936, Serial No. 63,925
In Great Britain February 15, 1935
13 Claims. (Cl. 66—190)

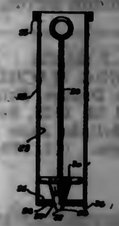


13. A knitted fabric embodying in addition to the stitch loops constituting it, a weft bar comprising a plurality of cores and binding thread binding them together, in which fabric certain stitch loops transfix the weft bar and extend between the cores thereof.

2,106,926
STORM SHUTTER
Edward W. Reiber, Miami, Fla.
Application August 28, 1936, Serial No. 98,397
3 Claims. (Cl. 189—55)

3. In a combined awning and window shutter, a hollow body portion, means for pivotally connecting the body portion to a window frame, said body portion having offset portions formed along its longitudinal side edges, providing guideways, a shutter section, bars secured to the longitudinal side edges of the body portion and disposed in the guideways, slidably mounting the shutter section within the body portion, means for swinging the body portion on its pivot, and means for restricting movement of the shutter section within the body portion.

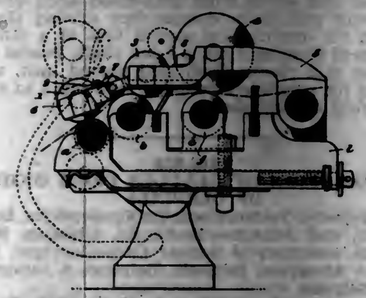
2,106,927
MANNEQUIN
Virginia McGhee Rice, Monticello, Ind.
Application December 14, 1936, Serial No. 115,831
2 Claims. (Cl. 223—68)



1. A mannequin comprising a torso including a head, arms and leg members, one of the said leg members being fixed rigidly to the torso and the other leg member being adjustable with respect thereto, said torso being provided with a downwardly tapering filler structure forming the upper portion of the rigid leg, said adjustable leg section being composed of an upper and a lower section, said upper leg section being disposed against one side of the filler and a second upper leg section disposed against the opposite side of the filler, said upper leg sections being detachably secured to opposite sides of said filler.

2,106,928
METHOD FOR THE POLYMERIZATION OF ROSIN
Alfred L. Russelsburg, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application February 8, 1936, Serial No. 63,629
16 Claims. (Cl. 87—2)

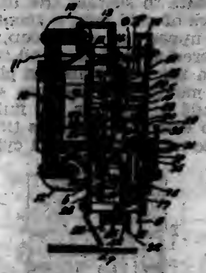
1. A method for the polymerization of rosin which includes bringing a solution of rosin in a monocyclic aromatic hydrocarbon into intimate contact with sulfuric acid having a concentration within the range of about 65% to about 102% by weight at a temperature within the range of about —10° C. to about 65° C. without substantial sulfonation of the rosin, separating the polymerized rosin solution from the sulfuric acid and recovering polymerized rosin by evaporating the monocyclic aromatic hydrocarbon.



2,106,929
PACKAGE PASTER
Charles L. Stratton, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
Application December 16, 1936, Serial No. 116,212
6 Claims. (Cl. 93—66)

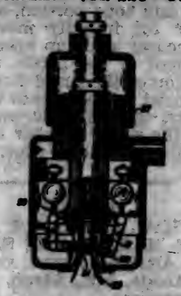
2. In a paste applicator, a bracket provided with a paste reservoir adapted to rest by gravity upon paper positioned beneath, said reservoir provided with a bottom having an external recess therein, an opening in said bottom, a tapered plug mounted through said opening and extensible beyond the plane of the edge of said bottom, said

plug being adapted to close said opening when the reservoir is raised from contact with the paper, and adapted to permit the flow of paste through said opening when the reservoir and the tapered plug are rested upon the paper.



2,106,930
DOUBLE THREE-ROLLER DRAWING FRAME
Herbert Strolak, Grevenn, Germany, assignor to Baumwollspinnerei Grevenn, Grevenn, Germany
Application February 6, 1935, Serial No. 5,294
In Germany August 30, 1934
2 Claims. (Cl. 19—134)

1. In double three roller drawing frames with upper and lower drawing cylinders, bearings for said drawing cylinders, a carrier cylinder having pivots extending a relatively short distance from the ends thereof, said pivots being of curved convex outline and increasing in cross section towards the cylindrical part of said carrier cylinder and a neck portion connecting said pivots to the cylindrical part of the carrier cylinder, an adjustable cap bar carried on said frame, steel plate adjusting slides screwed on said adjustable cap bar and engaging like riders the bearing points of said pivots so that the adjusting slides form at their upright edges abutments for the curved pivots of said carrier cylinder by producing point-like bearings.

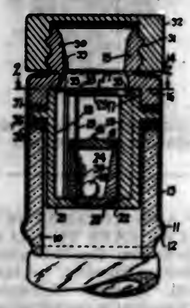


2,106,931
ELECTRIC CLOCK MECHANISM
Ivan Trepanier, Waterbury, Conn.
Application August 7, 1935, Serial No. 35,186
3 Claims. (Cl. 58—36)

1. In an electric clock including a field structure; a balance wheel of magnetizable material, a pair of inverted U-shaped pole pieces, each of the said inverted U-shaped pole pieces having one of their leg portions secured to the field structure and the remaining leg portion disposed along

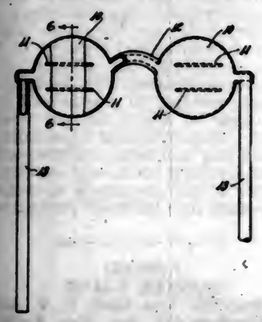
opposite side portions of the balance wheel and in magnetic relation with respect thereto.

2,106,932
METHOD OF AND APPARATUS FOR APPLYING CLOSURE CAPS TO RECEPTACLES
Ernst von Segebaden, Drottningholm, and Bror Johnson, Alsten, Sweden, assignors to Aktiebolaget Gerh. Arehns Mekaniska Verkstad, Stockholm, Sweden, a corporation of Sweden
Application October 31, 1934, Serial No. 750,890
In Sweden November 4, 1933
14 Claims. (Cl. 226—87)



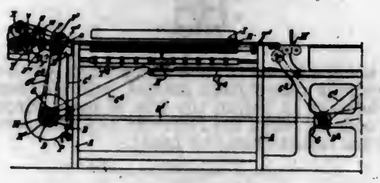
1. Apparatus for applying a closure cap having a depending skirt to the mouth of a receptacle, comprising capping tools, said tools being singly mounted for movements at substantially different levels transversely to the receptacle to yieldingly press different longitudinal sections of the skirt against said receptacle, one of said tools being operative to move progressively longitudinally of the receptacle relative to another of said tools through a range of action beyond that of said other tool, the transverse and longitudinal movements of said one tool being independent of any other of said capping tools, and accommodating to the contour of said receptacle to force the material of the skirt into intimate contact with said receptacle.

2,106,933
BOTTLE VALVE
James W. Wandell, New York, N. Y., assignor to Browne-Vintners Co., Inc., New York, N. Y., a corporation of New York
Application February 9, 1937, Serial No. 124,869
1 Claim. (Cl. 215—22)



In a bottle valve, in combination, a valve cup having a fluid opening therein, arranged to be positioned in the neck of a bottle, guide rails providing ridges along the inner wall of said cup and terminating short of the top of the cup to

present seats, a guard disk for partly closing the top of the cup, tabs on the disk arranged to rest in the said seats to sustain the disk flush with the upper edge of said cup, a spout member fitting over the upper end of the cup, said member being shouldered at its lower end to fit over the tabs to retain the guard disk in place, a hollow closed valve member in the cup slidable along said guide rails to uncover the fluid opening in the valve cup when the bottle is tilted for pouring, said valve member having a cylindrical body



portion, the inner wall of which is tapered and a bottom conical shaped portion, the inner wall of which portion is more acutely tapered than the inner wall of said body portion, a ball inside the valve member for initially moving said valve member to uncover said cup opening during the tilting movement of the bottle, means for preventing adhesion of the guard disk and the valve, a sleeve arranged to encompass the neck of the bottle and part of said spout member, and the outer end of the spout member being shaped to provide a non-drip pouring edge.

2,106,934
THERAPEUTICAL APPLIANCE AND METHOD OF MAKING THE SAME
Raymond W. Albright, Akron, Ohio, assignor to American Anode, Inc., Akron, Ohio, a corporation of Delaware
Application March 31, 1934, Serial No. 718,402
13 Claims. (Cl. 128—399)

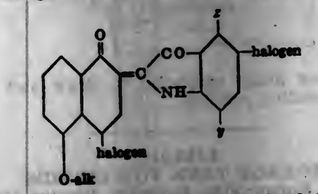
1. A rubber article adapted for therapeutical use in treating an area of a human body, comprising a thin walled and somewhat distensible closed hollow rubber bag of relatively large cross-sectional area designed substantially to cover the area to be treated, an integral rubber web joining two sides of the rubber bag for a substantial distance in such manner as to limit the distention of the bag, and two less distensible fluid conduits of relatively small cross-sectional area communicating with said bag at generally opposed points in such manner as to direct fluid through the interior thereof from one conduit serving as a fluid inlet to the other conduit serving as a fluid outlet.

2,106,935
FOLDING MACHINE
William Horace Draper, Bristol, England
Application April 24, 1935, Serial No. 18,062
In Great Britain June 21, 1934
13 Claims. (Cl. 270—61)

1. In a folding machine of the character described, a feeder, at least one folding device, a tape feed for conveying paper sheets from said feeder to the folding device, a tape feed driving shaft, a main drive shaft in timed driving connection with said folding device, a unit on said tape feed driving shaft, means for driving said unit at one speed from said main drive shaft, a second unit on said tape feed driving shaft, means for driving said second unit at a different speed from said main drive shaft, means for driving said feeder from said second unit, and means for selectively coupling said units to said tape feed driving shaft.

2,106,936
PREPARATION OF GLYCOLS FROM OXIDES OF OLEFINES
Paul Ferrero, Tertre, Corneille Vandendries, Baudour, and François Berbé, St. Ghislain, Belgium, assignors to Societe Carbochimique, Société Anonyme, Brussels, Belgium, a company of Belgium
No Drawing. Application April 13, 1937, Serial No. 136,690. In Belgium May 7, 1936
3 Claims. (Cl. 260—156.5)

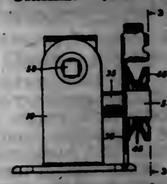
1. In a catalytic process of preparing glycols, causing an oxide of olefine to react with water in the presence of oxalic acid, and then eliminating the oxalic acid.



2,106,937
METHOD FOR THE PRODUCTION OF ARALKYL HALIDES
Lloyd H. Fisher, deceased, late of Wilmington, Del., by Anson B. Nixon, administrator, Holly Oak, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application March 19, 1935, Serial No. 11,830
19 Claims. (Cl. 260—160)

1. The method of producing an aralkyl halide which includes heating a di-aralkyl ether with a hydrogen halide at a temperature above 100° C.

3. The method of producing an aralkyl halide which includes heating a di-aralkyl ether with a hydrogen halide in the presence of a heavy metal halide.

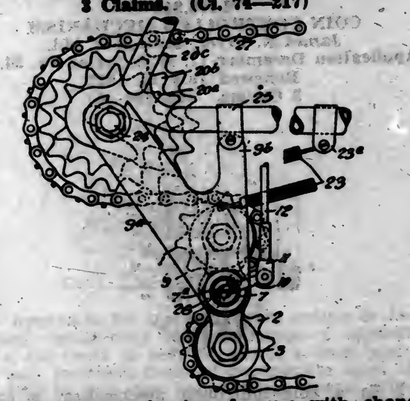


2,106,938
INDIGOID DYESTUFFS
Eduard Kambli, Basel, Switzerland, assignor to Society of Chemical Industry in Basle, Basel, Switzerland
No Drawing. Application July 3, 1936, Serial No. 88,895. In Switzerland July 15, 1935
4 Claims. (Cl. 260—49)

1. Indigoid dyestuffs of the general formula

wherein alk represents a radical of the lower aliphatic series, x a member of the group consisting of hydrogen and methyl, and y a member of the group consisting of methyl, methoxy and halogen, which dyestuffs are blue powders yielding in cotton printing blue to blue-green tints of excellent fastness.

2,106,939
REGULATOR FOR VENETIAN BLINDS
William Weaver Lewis, Port Washington, N. Y.
Application September 12, 1936, Serial No. 100,463
3 Claims. (Cl. 156—17)



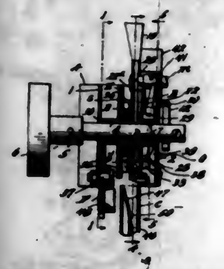
1. In a tilting mechanism for a Venetian blind including a tilt bar and a header bar, the combination comprising a housing attachable to the header bar, the housing having securing means and a compartment, means attachable to tilt bar, a projection of a configuration other than circular provided on the attachable means, means rotatably mounted in the compartment and arranged to receive the projection so that the attachable means can be mounted interchangeably on either side of the housing, and means having a portion rotatably mounted in the compartment in engagement with the rotatable means and another portion projecting externally of the compartment to support a pulley.

2,106,940
PROCESS FOR MAKING DI-CALCIUM PHOSPHATE
Walter H. MacIntire, Knoxville, Tenn.
No Drawing. Application May 3, 1934, Serial No. 723,907
11 Claims. (Cl. 23—109)

1. The process of making di-calcium orthophosphate of approximately 95% purity which consists in adding to an approximately 85% phosphoric acid solution an amount of approximately pure limestone comminuted to pass a 100 mesh sieve in the approximate proportion of 294 parts of H_3PO_4 and 300 parts of $CaCO_3$, together with water amounting by weight to from 25% to 50% of the limestone and vigorously agitating the mixture to a granular condition.

2,106,941
CHANGE SPEED GEAR MECHANISM FOR CYCLES AND THE LIKE
Joseph Thomas Morgan, Cardiff, Wales
Application March 23, 1937, Serial No. 132,576
In Great Britain April 14, 1936
3 Claims. (Cl. 74—217)

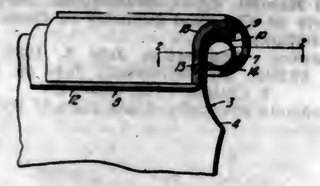
1. Shifting mechanism for use with change speed gear for chain and sprocket gear propelled cycles and the like in which a number of sprockets of varying diameters are adapted to be selectively engaged by the chain, a bracket fixed to the cycle frame, a tubular supporting member carried by said bracket, a rocker arm, a pivot member fixed to the rocker arm between the ends of the arm, a pair of jockey sprockets carried by the ends of the rocker arm, said tubular supporting member slidably and rotatably accommodating said pivot member, a helical slot in said tubular member, a lever comprising substantially radial pin carried by said pivot member passing through said slot, an upstanding rod connected at its lower end to said pin, a substantially horizontal rod, a lever connecting the upper and rear ends of the upstanding and substantially horizontal rods respectively, and a gear selecting control device connected to the front end of the substantially horizontal rod for imparting a push-pull operation to said radial pin to impart by reason of said pin and helical guide a movement of translation of the rocker arm simultaneously with arcuate movement thereof.



2,106,942
TAMPERPROOF SEAL AND METHOD OF PRODUCTION
Ralph S. Peirce, Hinsdale, Ill.
Application March 13, 1935, Serial No. 10,775
6 Claims. (Cl. 40—2.2)

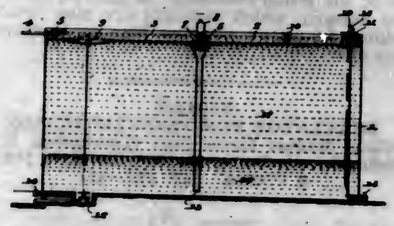
2. As an article of manufacture, a tamperproof seal including a soft metal member having in its initial form an identifying figure upon a face thereof formed by a groove depressed below the normal surface of said face the member being thereafter expanded in the plane of said face by compression in a direction normal to said face over an area materially greater than the figure,

the figure remaining visible but altered in configuration after compression, and a second identifying figure upon said face formed by said compression of the member.



2,106,943
COIN CONTROLLED MECHANISM
James N. Pryor, Baltimore, Md.
Application December 17, 1935, Serial No. 54,892
Renewed July 13, 1937
3 Claims. (Cl. 194—1)

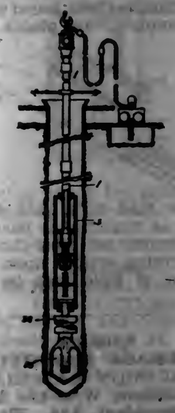
3. In a coin-controlled mechanism, a coin chute, a shaft, a circular coin carrier mounted on the shaft so as to turn therewith and having a coin passageway with inlet and outlet openings at its peripbery, stops for limiting the movement of the carrier, a spring normally holding said carrier against one stop with the inlet to said passageway in position to receive a coin from said chute, means for yieldingly holding a coin at the inlet of said passageway, a star wheel journaled on the shaft adjacent the carrier, a lever centrally pivoted on one side of the carrier to rock transversely of the plane of the carrier, and having a projection on one end movable across the inlet of the coin passageway, a dog connected to the opposite end of the lever and movable into and out of the path of the star wheel arms, a stationary cam adapted to rock the lever so that the projection will be out of the plane of the coin inlet and the dog will be in the plane of the star wheel at each end of the movement of the carrier, and a spring adapted to rock the lever in the opposite direction during an intermediate part of the movement of the carrier, whereby if a coin is in the inlet during the movement of the carrier to its discharge position, said projection will engage the side of the coin and the coin will prevent the lever from rocking the dog out of the plane of the star wheel and the dog will operate said wheel, and if there is no coin in the inlet the lever will rock the dog out of the plane of the star wheel.



2,106,944
CLOSING AND REENFORCING RING UNIT
Richard S. Rheem, Oakland, Calif., assignor to Rheem Manufacturing Company, a corporation of California
Application April 8, 1935, Serial No. 15,222
2 Claims. (Cl. 220—61)

1. The combination with a drum body having a peripheral outwardly rolled extension at an open end and a removable head having a peripheral extension for cooperation with said body extension and an offset portion with its sides arranged to fit against the inner sides of the drum walls, a continuous backing ring of relatively strong construction insertible and fitting within said sides of the head so as to be embraced thereby and having a radial strengthening flange extending over the peripheral extension of said head, and a clamping ring engageable with said

flange and drum extension to draw and hold same in sealing relation.

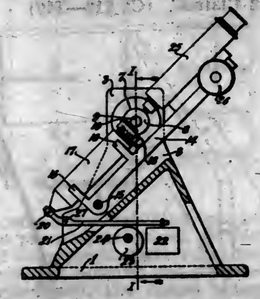


2,106,945
STORAGE TANK FOR LIQUIDS
Arnold Runge, Villa Ballester, Buenos Aires, Argentina
Application February 26, 1937, Serial No. 127,964
7 Claims. (Cl. 220—85)

1. In a storage tank for liquids, particularly for inflammable or non-inflammable liquids of a volatile nature having an auxiliary tank disposed on top of the storage tank proper for the purpose of containing a pressure liquid of greater specific gravity than and immiscible with the liquid to be stored, said auxiliary tank being connected with the interior of the storage tank by a pipe connection, an intake and discharge pipe for the stored liquid extending upwardly into a dome disposed on the top of said tank, the upper aperture of said intake and discharge pipe being placed at a higher level than the level of the pressure liquid contained in the auxiliary tank on top of the storage tank, and yielding power-transmitting means such as a diaphragm built into the top of said tank, said yielding means effecting with the aid of adequate transmission means, such as connecting rods, the outflow of a corresponding amount of pressure liquid by opening closure devices upon exceeding a pre-established internal pressure within said storage tank.

2,106,946
HYDRAULIC BORING MECHANISM
Theo Seifer, Berlin, Germany
Application November 1, 1935, Serial No. 47,889
In Germany September 22, 1933
5 Claims. (Cl. 255—4)

1. In a hydraulic mechanism, the combination of a vertical hollow shaft, a hollow piston rigidly and coaxially connected therewith, a cylinder closed at the top enclosing the said piston, a chisel carried by the cylinder, the interior of the hollow shaft below the upper surface of the piston being enlarged to form a valve chamber, a valve seat at the base of the chamber situated in a substantially horizontal plane, a valve body fitting into said seat, the hollow shaft communicating through ducts with the spaces above the piston and through other ducts with the space below the piston and the valve, and a resilient member transmitting the reciprocative movement of the cylinder to the said valve body.



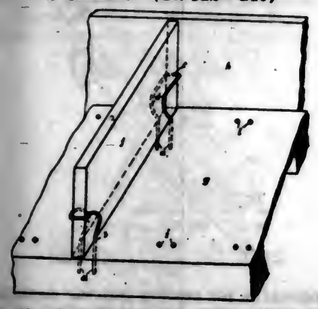
2,106,947
HYDRAULIC MOTOR FOR DEEP-BORING MECHANISMS
Theo Seifer, Berlin, Germany
Application November 26, 1935, Serial No. 51,632
In Germany February 27, 1935
9 Claims. (Cl. 255—4)

1. In a boring mechanism, the combination of a tubing through which the flushing fluid flows, a piston on the said tubing, a cylinder sliding over the piston, a main valve in the said tubing, a chamber in the tubing beneath the valve seat, apertures being provided in the said chamber for the discharge of the flushing fluid, an auxiliary valve in the said chamber, a rod extending from the body of the auxiliary valve and a second rod adapted to be lifted with the cylinder and adapted to strike the first named rod thereby opening the auxiliary valve after the cylinder has passed a certain way from its lowest position, the main valve being actuated by the variations of the hydraulic pressure connected with the opening and closing of the auxiliary valve.

2,106,948
TESTING OF LUBRICATION AND WEAR
Robert Low Heron Smith, Mottingham, London, England
Application January 4, 1937, Serial No. 119,628
In Great Britain January 20, 1936
7 Claims. (Cl. 73—51)

5. Apparatus for testing bearing metals or lubricants comprising in combination a support for a specimen of bearing metal, a steel bearing ball, members disposed on opposite sides of the ball to grip the ball between them, driving means for rotating one of said members, and means for pressing the specimen support against the ball transversely to the axis of rotation of the driven member and ball.

2,106,949
VALVE HEAD STRUCTURE FOR CORE BARRELS
Leonard L. Snyder, Southgate, Calif., assignor to Elliott Core Drilling Company, a corporation of California
Application July 28, 1936, Serial No. 93,016
5 Claims. (Cl. 255—72)



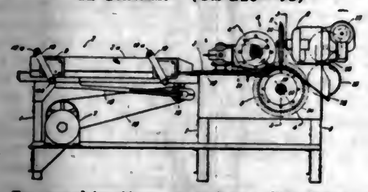
1. For use in combination with a core drill having an outer barrel member, a core barrel therein and a drill pipe secured to the top of said outer barrel, means for relieving the pressure within said core barrel during circulation of drilling fluid through said drill stem embodying: an elongated body mounted on the top of said core barrel and having a Venturi passage formed therein in the path of drilling fluid in said drill pipe, said body having a suction passage communicating between the throat of said Venturi passage and the upper end of said core barrel; and an upwardly opening check valve in said suction passage.

2,106,950

CLIP FOR THE ADJUSTABLE ATTACHMENT OF PARTITIONS IN SHOWCASES AND THE LIKE

Albert Sieber, Berlin-Pankow, Germany

Application July 7, 1936, Serial No. 89,435
In Germany August 21, 1935
2 Claims. (Cl. 312—140)



1. A clip for the adjustable attachment of partitions in show-cases and the like, comprising a piece of resilient wire bent in an inverted and substantially U-shaped fashion and including an intermediate connecting portion and two arms continuing therefrom, said arms being resiliently expanding at their free terminal portion and converging arcuately inwards toward each other between a point intermediate of their length and the intermediate connecting portion, and in which said inwardly extending arcuately curved portions of said arms are also arcuately bent in a direction at right angles to said arcuately bent portions, and the terminal portions being arranged in a plane parallel to but offset from the intermediate connecting portion.

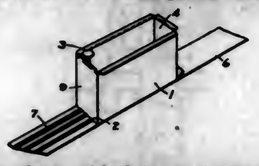
2,106,951

CUTTING MACHINE

Albert R. Thompson, San Jose, Calif., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware

Application September 2, 1933, Serial No. 687,928
11 Claims. (Cl. 146—78)

1. In combination, a rotary disc-type cutter having a helical cutting edge, a plurality of peripherally toothed feed-wheels in mesh with said cutting edge, said feed-wheels being mounted in side by side spaced relation to form channels therebetween for the reception of strips of material to be cut, and means for supporting said material as it is advanced between said feed-wheels.



2,106,952

STRIPING TOOL

John Urban, West New York, N. J.

Application July 14, 1937, Serial No. 153,599
5 Claims. (Cl. 91—62.6)

1. In a striping tool of the type having a reservoir in a container with a flat bottom, with slots in said bottom adjacent one side, and with notches in the lower edge of the side corresponding with said slots and communicating therewith; plates forming closures positioned above said slots and slidably mounted, said plates adapted to be

lowered to close said slots, said device characterized in that, as material is passed under the device, a fluid therein will flow through the slots and notches forming stripes upon the material, and the amount of fluid may be regulated by said plates.

2,106,953

FLEXIBLE PACKAGE FOR HYDROCOLLOID IMPRESSION MATERIALS

Walter J. van Roseem, West Los Angeles, Calif., assignor to Surgident, Ltd., West Hollywood, Calif., a corporation of California

Application June 5, 1936, Serial No. 83,647
2 Claims. (Cl. 206—46)

1. A moisture-impervious package comprising a body of moisture-containing hydrocolloid composition and an enclosing envelope completely surrounding said body, said enclosing envelope comprising a film of polymerized vinyl halide resin.

2,106,954

LUBRICATING COMPOSITION

Jones I. Wasson, Elizabeth, N. J., assignor to Standard Oil Development Company, a corporation of Delaware

No Drawing. Application December 20, 1934, Serial No. 758,427
6 Claims. (Cl. 87—9)

1. An improved lubricating composition of low oxidation rate and tendency to sludge, comprising a lubricating oil having a tendency to form sludge on oxidation and containing as an addition agent a small amount of an aliphatic hydroxy-sulfide in which the hydroxy radical and the sulfur are attached directly to the aliphatic group.

2,106,955

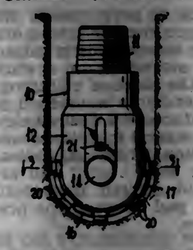
FLUID PASSAGE FOR DRILLING TOOLS

John A. Zublin, Los Angeles, Calif.

Application June 2, 1936, Serial No. 83,679
4 Claims. (Cl. 255—61)

1. A well drilling tool with cutting elements and an internal passage for circulation fluid, having an external fluid channel communicating at its upper end with the internal passage to receive fluid therefrom, said external channel being open to the tool exterior on one vertical side and at the lower end and so positioned on the tool in close proximity to the vertical well wall throughout substantially its entire length that the well wall at least partially closes the open

vertical side of the channel to confine downwardly moving fluid therein, and a second ex-



ternal channel in which the fluid moves upwardly past the tool.

2,106,956

ROTARY EARTH BORING TOOL WITH ROLLING CUTTERS

John A. Zublin, Los Angeles, Calif.

Original application March 30, 1936, Serial No. 71,660. Divided and this application July 15, 1936, Serial No. 90,780
20 Claims. (Cl. 255—71)

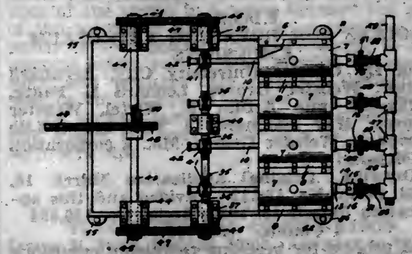
1. A cutter assembly for a deep well rotary earth boring tool comprising a generally circular, wheel-like cutter carrier adapted to be rotatably mounted on a tool body and having a plurality of radial slots around the carrier; a plurality of circumferentially extending pins welded to the carrier; and a roller type cutter in each slot rotatably mounted upon one of said pins.

2,106,957

FRICTIONAL WIRE CONNECTER

Jasper Blackburn, Webster Groves, Mo.

Application February 26, 1934, Serial No. 712,925
9 Claims. (Cl. 173—363)



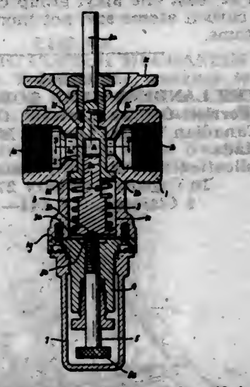
3. In a device of the kind described, an elongated keeper comprising two legs movably joined to move athwart one another in parallel planes for admitting wires therein between, the legs being spaced apart at transversely adjacent portions for providing the necessary wire receiving space, the outer sides of the legs being complementally rounded and segmentally screw threaded to engage a tapped nut, a tapped nut for engaging the said legs, and means operatively anchoring the nut to one of the legs so that the nut may be withdrawn to the end thereof for freeing the other leg for relative lateral movement for admitting the wires.

2,106,958

AIR COMPRESSING MACHINE

Walter J. Brightwell, Henderson, Tex.

Application October 20, 1936, Serial No. 106,628
2 Claims. (Cl. 230—134)



1. A compressor machine, comprising a base having a plurality of spaced parallel bars, a plurality of compressor units each including a piston, a cylinder housing the piston, a connecting rod coupled with the piston extending beyond one end of the cylinder, a pair of fins formed integral with each cylinder and extending longitudinally thereof, each of said cylinders being disposed between a pair of said parallel bars and having the fins thereof resting on and secured to said bars, a compressed air reservoir, an air lead-off pipe from each of said cylinders, a pipe line connecting each of said lead-off pipes with the reservoir, each of said lead-off pipes having an outwardly opening valve controlling the flow of air from the cylinder into the lead-off pipe, and power means coupled with said connecting rods for effecting simultaneous reciprocation of the same.

2,106,959

VALVE

George R. Brown, Shaker Heights, Ohio, assignor to The North American Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

Application August 1, 1936, Serial No. 93,858
5 Claims. (Cl. 277—25)

1. A valve body having inlet and outlet ports, a valve rotatably mounted in said body to control flow between said ports and having a slot extending from an end into the zone of said ports, a curtain mounted in said slot for sliding adjustment endwise of the valve to control its orifice, said valve and curtain having opposed head parts, stop means mounted on said valve body adjustable endwise of said curtain adjacent its

head part, and compression spring means arranged between said head parts to yieldably bear said curtain against said stop means.

2,106,960

PROCESS FOR BREAKING PETROLEUM EMULSIONS

Melvin De Groote, University City, Bernhard Keiser, Webster Groves, Leonard L. Faure, Kirkwood, and Arthur F. Wirtel, Webster Groves, Mo., assignors to The Tret-O-Lite Company, Webster Groves, Mo., a corporation of Missouri

No Drawing. Original application March 16, 1936, Serial No. 69,222. Divided and this application March 15, 1937, Serial No. 130,894

4 Claims. (Cl. 196—4)

1. A process for breaking petroleum emulsions of the water-in-oil type, which consists in subjecting the emulsion to the action of a demulsifying agent comprising a cyclohexylamine salt of a poly-alkylated naphthalene sulfonic acid in which there are present at least two different alkyl groups, each one containing at least three carbon atoms and not more than ten carbon atoms.

2,106,961

PROCESS FOR BREAKING PETROLEUM EMULSIONS

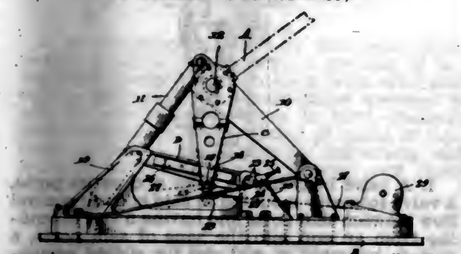
Melvin De Groote, University City, Bernhard Keiser, Webster Groves, Leonard L. Faure, Kirkwood, and Arthur F. Wirtel, Webster Groves, Mo., assignors to The Tret-O-Lite Company, Webster Groves, Mo., a corporation of Missouri

No Drawing. Original application March 16, 1936, Serial No. 69,222. Divided and this application March 15, 1937, Serial No. 131,006

4 Claims. (Cl. 196—4)

1. A process for breaking petroleum emulsions of the water-in-oil type, which consists in subjecting the emulsion to the action of a demulsifying agent comprising a cyclohexylamine salt of an alkylated naphthalene mono-sulfonic acid, in which at least one alkyl group contains at least three carbon atoms and not more than ten carbon atoms.

2,106,962



WINTER LANDING GEAR FOR AEROPLANES

Alan Ferrier, Ottawa, Ontario, Canada, assignor to Canadian Vickers Limited, Montreal, Quebec, Canada

Application July 8, 1937, Serial No. 152,637

In Canada February 27, 1937

9 Claims. (Cl. 244—108)

1. In winter landing gear for aeroplanes, skis mounted for pivotal movement in landing, a rigid member mounted on each ski adapted to move therewith and complementary rigid members mounted on the aeroplane, each adapted to cooperate with one of the rigid members on the ski, each pair of cooperating rigid members being designed to engage to lock the skis against pivotal movement and to disengage to permit pivotal movement of the skis responsive to predetermined relative movements between the aeroplane and skis.

2,106,963

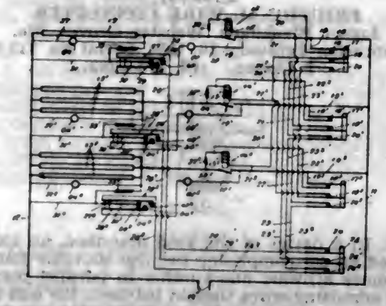
METHOD OF HAIR WAVING

Gotthard Freudenberg, New York, N. Y., and Alfred Edmund Reimers, Harrington Park, N. J., assignors to The Nestle-Lemur Company, New York, N. Y., a corporation of Ohio

Application February 3, 1936, Serial No. 62,094

20 Claims. (Cl. 132—36)

1. A process of permanently waving women's hair which comprises selecting a strand of hair, clamping the strand closely adjacent the scalp, winding the strand upon a curling rod until wound up to the place of clamping, enclosing the wound up strand in a moistened pad, preheating two metal surfaces to a desired elevated temperature to cause several minutes steaming of the pad without additional heating, indicating when the surfaces have been heated and are being maintained at said desired temperature, and then clamping the pad between the previously heated metal surfaces.



2,106,964

ELECTRICAL CIRCUIT FOR HAIR WAVING MACHINES

Gotthard Freudenberg, New York, N. Y., and Alfred Edmund Reimers, Harrington Park, N. J., assignors to The Nestle-Lemur Company, New York, N. Y., a corporation of Ohio

Application February 3, 1936, Serial No. 62,095

7 Claims. (Cl. 219—20)

1. An electrical control circuit for use in hair waving pre-heating machines comprising a plurality of resistance heaters, a plurality of main circuits one for each of said resistance heaters, a main switch in each of said circuits, a solenoid control for each of said main switches, manual means to energise said solenoids to close said main switches, thermostatic means to deenergise said solenoids and means to permit operation of only one main circuit at a time.

2,106,965

LATCH

Floyd E. Gray, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware

Application February 19, 1934, Serial No. 711,832

Renewed June 4, 1937

13 Claims. (Cl. 292—74)

1. A door latch including a bolt, a stiff spring and a weak spring each normally applying force to said bolt for urging the bolt into engagement with a keeper, means for preventing compression of said weak spring by movement of said bolt, said means being arranged to permit movement of said bolt to thereby compress said stiff spring while effective for preventing compression of said weak spring, and means for releasing said first named means.

2,106,966

BUFFING OR POLISHING WHEEL

Elisha W. Hall, Soltuate, Mass.

Application January 29, 1937, Serial No. 122,925

4 Claims. (Cl. 51—193)

1. A buffing or polishing wheel comprising, in combination, a plurality of sections each comprising a plurality of plies of flexible sheet fabric stitched together, said sections being joined together by annular zones of flexible adhesive at areas separated in a radial direction by areas not joined by adhesive and having a considerable degree of flexibility in a radial direction under pressure applied to the periphery of the wheel.

2,106,967

BRAKE BEAM SAFETY CARRIER

Fred A. Hamilton, Topeka, Kans.

Application November 28, 1936, Serial No. 754,829

1 Claim. (Cl. 188—210)

Safety means of the character described comprising in combination with the spring plank of a railroad car truck, a brake beam carrier consisting of a pair of plank straddling straps arranged transversely of the spring plank and bent so as to provide an intermediate horizontal portion disposed flush with the top face of the plank and upwardly bent portions adapted to straddle the longitudinal edges of the spring plank and to depend therefrom, the depending ends of the straps in a plane beneath the plane of the bottom of the plank being provided with partly severed portions bent outwardly to form integral ledges and thereby provide rectangular slots, and angular bars disposed through the slots of both straps in contact with the bottom of the spring plank and immovably secured to said ledges, the ends of the bars being provided with bent lips.

2,106,968

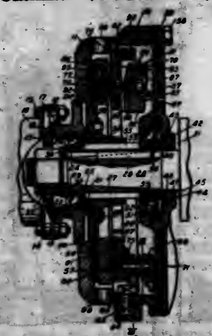
TRUCK TRAILER COMBINATION

Irving H. Judd, Detroit, Mich., assignor to Whitehead & Kales Company, River Rouge, Mich., a corporation of Michigan

Original application December 4, 1933, Serial No. 700,923. Divided and this application May 7, 1934, Serial No. 724,335

12 Claims. (Cl. 280—33.1)

1. A truck-trailer combination comprising a trailer provided with a chassis frame, transversely extending axles at the forward and rear ends of said frame, a fifth wheel connection between said chassis frame and the forward axle, automobile carrying means on the chassis frame in rear of the fifth wheel connection, and a draft vehicle for the trailer connected thereto and having automobile carrying means extending over the fifth wheel connection to a point adjacent the automobile carrying means on the trailer and constructed in such a way that it may be loaded from the automobile carrying means on the trailer or from the ground.

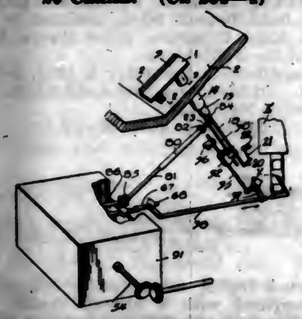


2,106,969

AUTOMATIC CLUTCH MECHANISM

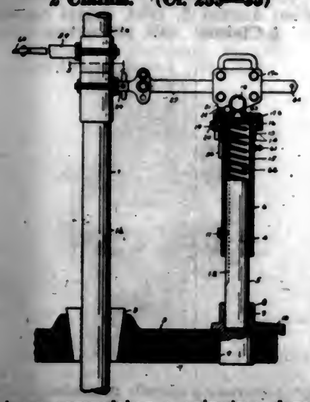
Robert P. Lewis, Toledo, Ohio, assignor to Automatic Drive & Transmission Company, Gloucester City, N. J., a corporation of New Jersey

Application August 2, 1933, Serial No. 683,383



5 Claims. (Cl. 192—105)

1. In an automatic clutch mechanism, in subcombination, a driving member and a reaction member mounted for relative axial movement



away from each other, levers journalled for oscillation in one of said members and adapted to force the said members away from each other when said levers are oscillated; speed responsive means for oscillating said levers when said members attain a predetermined speed; and means projecting from and integral with said reaction member and cooperating with said driving member for holding said levers under stress and tight in their journals when they are not under the influence of said speed responsive means.

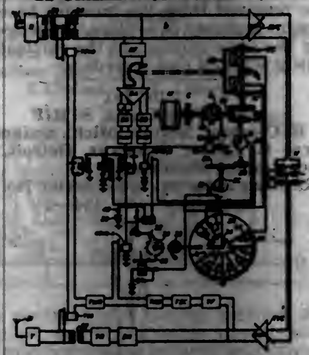
2,108,970
SYSTEM OF SPEED REGULATION
Edward G. McKinney, Enid, Okla.
Application April 20, 1934, Serial No. 721,643
20 Claims. (Cl. 264—4)

1. In an apparatus of the character described, the combination of a vehicle engine, a fuel supply line thereto, a throttle valve in the fuel supply line, manual means operatively related to said throttle valve for actuating the same, automatic means operatively related to the throttle valve for actuating the same, and means for simultaneously rendering one of said means effective and the other means ineffective to actuate said valve, said last-named means including mechanism continuously adjusting the automatic means to speeds developed by said engine when said valve is actuated by said manual means.

2,108,971
TONG
Carl E. Olsen and Joseph A. Petersen, Houston, Tex.
Application May 15, 1936, Serial No. 79,906
2 Claims. (Cl. 255—35)

1. A tong comprising a gripping element and a handle, a relatively strong connecting element between said gripping element and said handle for transmitting operating force in one plane from said handle to said gripping element, and relatively frangible connecting means between said gripping element and handle for normally preventing relative vertical movement of said gripping element and handle, said last means being frangible to permit relative vertical movement of said gripping element and handle when predetermined vertical forces are applied tending to move said gripping element and handle relative to each other.

2,108,972
VEGETABLE SLICER
Arnold E. Orner, Readersville, Pa.
Application August 11, 1936, Serial No. 95,471
1 Claim. (Cl. 146—163)

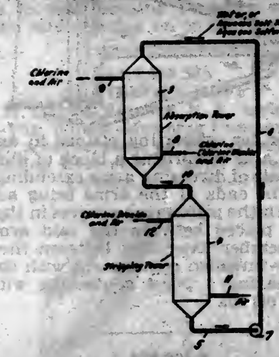


A vegetable slicing device comprising a body portion having horizontally extending plates lying in two vertically spaced planes and overlapping at their adjacent edge portions, a horizontal cutting blade carried by said overlapping edge portion of the uppermost plate, the overlapping edge portion of the lowermost plate having spaced slots extending at right angles to and terminating at their inner ends substantially in vertical alignment with the cutting edge of said horizontal blade, a plurality of rotary cutting blades positioned beneath the upper horizontal plate and rotating partly within said slots, said rotary blades being positioned relative to the edge of the horizontal cutting blade so as to act on the vegetable slice after it is cut by the horizontal blade, and a slide having surfaces cooperatively arranged with respect to said vertically spaced plates, said slide having a vegetable receiving opening in the portion cooperating with the uppermost plate and a plurality of transversely spaced, longitudinally extending fingers carried by the portion which cooperates with the lowermost plate and adapted, when the vegetable opening has passed by the horizontal cutting blade, to pass beneath the said horizontal blade and between the rotary cutting blades to effect completion of the cutting of the slice into strips and to free said strips from the spaces between said rotary blades.

2,108,973
PNEUMATIC TIRE
Donald Parkinson, Sutton Coldfield, England, assignor to Dunlop Tire and Rubber Corporation, a corporation of New York
Application November 5, 1936, Serial No. 109,253
In Great Britain September 2, 1935
5 Claims. (Cl. 152—18)

1. A pneumatic tire comprising a plurality of fabric casing plies, a tread superposed on said plies and having relatively thin side walls extending over said wall portions of said plies, an intermediate body of relatively soft cushion rubber vulcanized to the tread and casing plies, and a breaker strip of uniformly flexible rubber harder than that of the tread embedded in said cushion rubber below the tread portion of the tire, terminating short of the side walls of the tire and separating all of said plies from said tread.

2,108,974
TWO-WAY SIGNALING SYSTEM
Lionel Schott, East Orange, N. J., assignor to American Telephone and Telegraph Company, a corporation of New York
Application November 20, 1936, Serial No. 111,933
11 Claims. (Cl. 178—44)

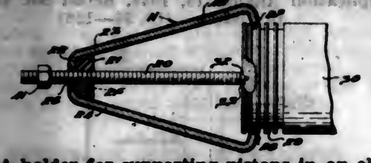


1. In a two-way telephone system having one path adapted for transmission in a receiving direction and a second path adapted for transmission in a transmitting direction, voice operated means connected to each of the paths for preventing transmission over one of the paths when transmission is being effected over the other, testing means connected to the receiving path and responsive proportionately to the static or noise energy in that path, and means operating from time to time in accordance with the energy indicated by said testing means to adjust the sensitivity of the voice operated means connected to the receiving path.

2,108,975
REINFORCING NUT
Henry Pierce Sorensen, Detroit, Mich.
Application March 18, 1936, Serial No. 69,633
1 Claim. (Cl. 85—32)

A nut adapted to be riveted to sheet material, said nut comprising a flat rectangular body having a central threaded hole and having a notch in each end, the material from the notches being bent up towards the center of the nut to form rivets projecting up from one face of the nut, the base of each rivet being surrounded on three sides by the flat body of the nut.

2,108,976
PRODUCTION OF CHLORINE DIOXIDE
George Paul Vincent, Niagara Falls, N. Y., assignor to The Mathieson Alkali Works, Inc., New York, N. Y., a corporation of Virginia
Application August 15, 1934, Serial No. 739,888
10 Claims. (Cl. 23—153)



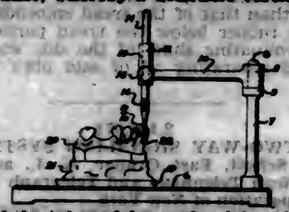
1. In the production of chlorine dioxide, the improvement which comprises separating chlorine dioxide from a gas mixture including chlorine and chlorine dioxide by selective absorption of the chlorine dioxide in aqueous sulfuric acid, and recovering chlorine dioxide from the absorption medium.

2,108,977
MEANS FOR COOLING AND FILTERING LIQUIDS
Marcel Vuilleume, Paris, France
Application March 21, 1936, Serial No. 70,115
In Germany March 25, 1935
7 Claims. (Cl. 123—196)

1. In combination with an engine having a liquid circulating system, a propeller driven by said engine and means located within said propeller for allowing circulation of said liquid within said engine and within the blades of said propeller and for centrifuging said liquid by utilising the centrifugal force set up by the rotation of said propeller when in operation, said means including separate supply and return passages leading from said engine to the hub of said propeller and thence lengthwise of the blades and approximately to the tips thereof and reservoirs located adjacent said tips in communication with said passages for collecting the sediment centrifugally separated from said liquids.

2,106,978
RACK
Fred A. Wales, Detroit, Mich.
Application November 20, 1935, Serial No. 50,647
8 Claims. (Cl. 204—5)

1. A holder for supporting pistons in an electrolytic bath and comprising a block of dielectric material, a pair of diverging arms extending from said block, the ends of the arms being adapted to engage with the piston ring grooves in the head of a piston placed between the said arms, an extensible member extending between the arms and in screw-threaded engagement with the said block and having a point contacting with the head of the piston.



2,106,979
VALVE
Daniel D. Wills, Detroit, Mich., assignor to Detroit Lubricator Company, Detroit, Mich., a corporation of Michigan
Application July 9, 1935, Serial No. 30,439
6 Claims. (Cl. 137—139)

1. A device of the character described, comprising a body having inlet and outlet ports, a valve in said body for controlling flow of a fluid passing through the body from the inlet to the outlet port, said fluid passing from the inlet to the outlet exerting a force against the valve to retard movement of the valve in one direction, means for moving said valve in the opposite direction, duct means in open communication with said inlet for conveying the fluid to the other side of the valve to exert a force thereagainst whereby to retard movement of said valve in the opposite direction, and yieldable means acting to move said valve in one of said directions.

2,106,980
DENTAL MODEL SURVEYOR
Noble G. Wills, Connersville, Ind.
Application August 6, 1934, Serial No. 738,612
3 Claims. (Cl. 32—67)

2. In a dental instrument of the class described, a stationary base, an upright carried by said stationary base, an horizontal arm pivoted on said upright, a tool carried vertically by said horizontal arm for movement vertically and horizontally relative to the stationary base, a movable base carried upon said stationary base, a permanently plastic substance carried by said movable base for supporting a dental model and permitting substantially universal movement of said dental model at any time with respect to said movable base, whereby a desirable vertical angle

upon said dental model may be determined and recorded thereon and whereby said dental model may be removed from the movable base and the instrument and may be replaced thereupon at any time in the same relation to the vertical angle as previously selected and recorded.

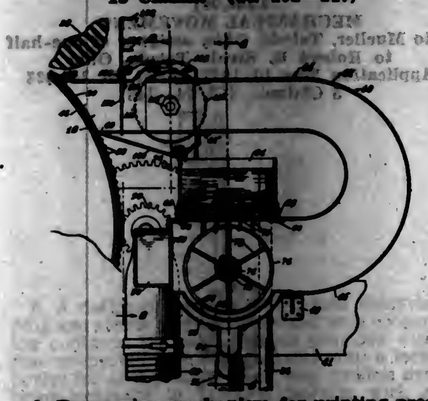
2,106,981
MOLDED CORE STRIP
Edgar R. Creamer, Detroit, Mich., assignor to The George R. Carter Company, Detroit, Mich., a corporation of Michigan
Application June 14, 1935, Serial No. 26,644
3 Claims. (Cl. 154—2)

1. The method of making a molded core strip as a filler for trimming of the character described which embodies running a strip of paper and a cord concomitantly to contact through an adhesive bath, guiding them together thence to a drier and drying them so that they adhere to each other and become a unit, passing the unit through forming rolls and curling the edges of the paper inwardly over the cord and finally crushing the curled paper about the latter so that paper and cord constitute a homogeneous hard and bendable mass with the cord lying substantially centrally thereof.

2,106,982
APPARATUS FOR DEVELOPING FILM IN DAYLIGHT
John Eggert, Leipzig-Gohlis, and Fritz Luft, Leipzig, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
Application January 22, 1936, Serial No. 60,126
In Germany January 24, 1935
5 Claims. (Cl. 95—90)

1. An apparatus for developing dental film in day light which comprises a casing, a chamber

in said casing for a dental film pack encased in a protective paper strip, a further chamber below said first chamber and communicating therewith by a slot for allowing the transport of said films from said first into said second chamber, said casing having a slot in a wall thereof leading

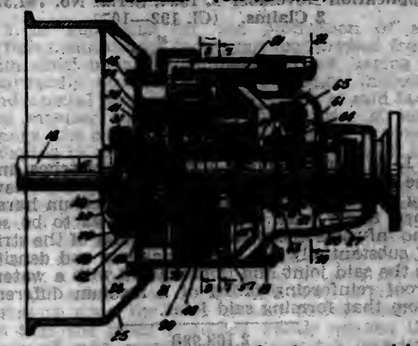


from said first chamber for the reception of said protective strip, means for excluding the entrance of light through said latter slot, said second chamber having an opening therein for the admission of a treating fluid and means for preventing entrance of light through said opening.

2,106,983
TELEPICTURE SYNCHRONIZING SYSTEM
William G. H. Finch, New York, N. Y.
Application May 11, 1936, Serial No. 78,903
6 Claims. (Cl. 178—68.5)

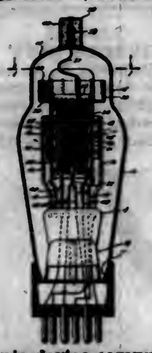
1. In a synchronizing system, a driven shaft; a driving shaft; gearing effecting a continuous mechanical interconnection between said driving and driven shafts; mechanism mechanically connected to and normally rotated with said gearing interconnection for independently controlling the rotation of said driven shaft without interrupting said continuous mechanical interconnection; and a synchronizing magnet responsive to cyclic synchronizing signals for cyclically arresting the rotation of said mechanism in the event said driven shaft is not in synchronism and until said driven shaft is in synchronous position.

2,106,984
DAMPENER FOR PRINTING PRESSES
Elmer C. Grunewald, Chicago, Ill.
Application August 29, 1936, Serial No. 98,451
15 Claims. (Cl. 101—147)



1. Dampening mechanism for printing presses and the like comprising a housing having an opening for confrontation with a press plate cylinder, means providing a water spray in said housing, a power driven propeller supported within the housing and having a plurality of apertured arms rotatable to intercept said sprays and break up the water into fine particles, together with means for moving air past said propeller means in said housing to carry said particles through said opening on to said cylinder.

2,106,985
FIBROUS BUFF
Louis M. Hague, Ramsen, N. J., assignor to Hansen-Van Winkle-Manning Company, Matawan, N. J., a corporation of New Jersey
Application December 2, 1936, Serial No. 113,768
1 Claim. (Cl. 51—193)



A buffing wheel composed of alternating layers of cloth and mats of felted sisal fibers stitched together, the sisal fibers being bound only by the cloth and stitches and their felted arrangement.

2,106,986
SYNCHRO SELECTIVE CONSTANT MESH TRANSMISSION
Gustav A. Klaue, East Rutherford, N. J., assignor to Diehl Corporation, New York, N. Y., a corporation of New York
Application June 12, 1935, Serial No. 26,111
13 Claims. (Cl. 74—259)

1. Power transmitting mechanism comprising, in combination, an inertia impulse transmitter having a torque characteristic such that at idling speed no appreciable torque is transmitted, a driving shaft driven by the transmitter, a driven shaft coaxial with the driving shaft, power transmitting means between the shafts including means to engage the driven shaft positively with the driving shaft, and means responsive to a relative movement between the driving and driven shafts to relieve surface pressure of the means which engage the driven and driving shafts.

2,106,967
SHOCK ABSORBER FOR THE ELEMENTS OF THERMIONIC TUBES
Walter Louis Krahl, Montclair, N. J., assignor, by mesne assignments, to Arcturus Development Company, Newark, N. J., a corporation of Delaware
Application February 13, 1932, Serial No. 656,490
27 Claims. (Cl. 250—27.5)

1. A thermionic device comprising an envelope, a press within said envelope and integral therewith, a support member within said envelope and having its lower end mounted upon said press, a plurality of adjustable mica elements, apd means to detachably secure said elements upon the upper end of said support member with said elements protruding outwardly so that their ends contact with the inner walls of said envelope, said elements lying in planes substantially parallel to the axis of the support member.

2,106,968
FRICTION MATERIAL AND METHOD OF FORMING SAME
James N. Longley, Chinley, England, assignor to Ferodo and Asbestos Inc., Ambler, Pa., a corporation of New York
Application November 3, 1934, Serial No. 751,321
2 Claims. (Cl. 192—107)

1. A lining member for brakes, clutches and the like comprising a strip in circular form having overlapping ends joined by a medium hardened under heat and pressure so as to be set and infusible and with the remainder of the strip of substantially the same thickness and density as the said joint and impregnated with a waterproof reinforcing filling of a medium different from that forming said joint.

2,106,969
ROTATION MECHANISM
Albert R. Mack, Easton, Pa., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey
Application March 22, 1937, Serial No. 132,911
9 Claims. (Cl. 121—7)

1. Rotation mechanism, comprising a casing, a rotatable chuck member, a reciprocatory member on the outside of the rotatable chuck member, means on the members slidably interlocked with each other and being adapted to effect relative rotary movement between the members upon reciprocation of the reciprocatory member, and means for preventing rotational movement of the reciprocatory member during alternate

strokes thereof and thereby cause said reciprocatory member to impart rotary movement to the rotatable chuck member.

2,106,990
APPARATUS FOR THE CONTINUOUS SPLITTING OF FATS OR OILS
Emil Merlock, Frankfort-on-the-Main, Germany, assignor to American Lurgi Corporation, New York, N. Y., a corporation of New York
Application July 6, 1936, Serial No. 89,137
In Germany January 15, 1935
2 Claims. (Cl. 87—4)

1. Apparatus for the continuous splitting of fats or oils comprising a horizontal autoclave of elongated form, intake and outlet openings at opposite ends of said autoclave to introduce liquid material to be treated thereinto and to remove treated material therefrom, a shaft rotatably mounted in said autoclave in the direction of the longitudinal axis thereof, a plurality of stirring devices spacedly mounted on said shaft, each of said stirring devices including a pump-like rotor body having intake ports in the central portion thereof and outlet ports in the peripheral portion thereof and being capable of causing powerful circulation of said material along a plurality of circular paths in a vertical plane, partition walls between said stirring devices restraining said material against displacement in the horisontal direction, and relatively small openings in said partition walls for transferring small quantities of liquid from each stirring device to the subsequent one in accordance with the admission of fresh liquid to be treated to the autoclave.

2,106,991
MECHANICAL MOVEMENT
Otto Mueller, Toledo, Ohio, assignor of one-half to Robert E. Strub, Toledo, Ohio
Application May 10, 1937, Serial No. 141,623
5 Claims. (Cl. 74—143)

1. Means to transform a reciprocating driving motion into a unidirectional motion which includes, a drive member, an ultimate driven member, two intermediate driven members separately connected to said ultimate driven member, and separate oppositely acting clutch means interposed between each of said intermediate driven members and said drive member.

2,106,992
DEVICE FOR CUTTING FRUIT INTO SECTORS
Neal Obenchain, Piedmont, W. Va.
Application August 12, 1936, Serial No. 95,837
1 Claim. (Cl. 146—180)

A device for cutting fruit into sectors comprising a circular cup-like receptacle built onto a flange-like base, said receptacle having upstanding walls with an inside depth substantially greater than one-half the inside diameter, the walls of the receptacle having radially arranged vertical slots intersecting at the center of the receptacle, the slots extending from the top to the bottom of said walls and being open at the top to receive a knife, a knife stop of soft material located in the bottom of the receptacle and centrally thereof, said base having a groove in its top surface adjacent to and encircling said receptacle and communicating with said slots.

2,106,993
CUT-OUT
Allan Ramsey, Evanston, Ill., assignor to Schweitzer & Conrad, Inc., Chicago, Ill., a corporation of Delaware
Application June 9, 1934, Serial No. 729,975
49 Claims. (Cl. 200—114)

5. A device of the class described comprising plug and socket members provided with cooperating contacts, the plug member provided with a fuse connected with said contacts, and a locking device for said plug member, said locking device being normally in released position with said plug in place in said socket and operable only at the instant required.

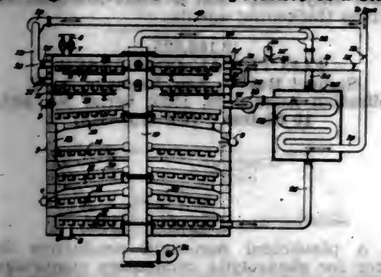
2,106,994
DYESTUFF PRINTING PASTE
Walter Reppe, Friedrich Hoelscher, and Alwin Schneeweigt, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application September 30, 1936, Serial No. 103,283. In Germany October 5, 1935
4 Claims. (Cl. 8—6)

1. Dyestuff printing pastes containing water-soluble interpolymerization products of a water-soluble vinyl ether and a water-insoluble vinyl ether as thickening agents.

2,106,995
ELECTRICAL CONDENSER
Samuel Ruben, New Rochelle, N. Y.
Application August 26, 1933, Serial No. 686,887
10 Claims. (Cl. 175—315)

1. A plasticised non-rigid conductive sheet spacer for electrolytic condensers comprising a flexible non-fibrous gelatine sheet of a thickness substantially not greater than .002", impregnated with a conductive electrolyte so as to afford a conductive path therethrough.

2,106,996
MEANS FOR PRODUCING A CAST ARTICLE WITH A FACING OF SHEET METAL
Ralph Dunstan Sansome, Birmingham, England, assignor of one-half to William Pilkington, Wylde Green, England
Application June 23, 1936, Serial No. 86,285
In Great Britain December 19, 1932
4 Claims. (Cl. 22—58)

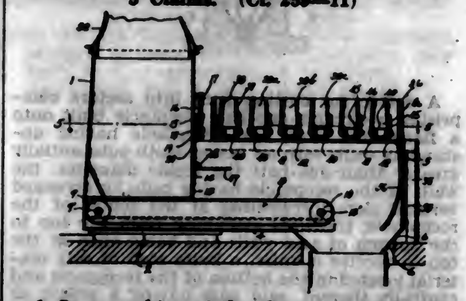


1. In apparatus for the production of an article comprising a facing member pressed from thin sheet metal, said facing member having a rearwardly directed peripheral flange thereon, and a metal body cast on to the back of said facing member and engaging the interior of said flange, the combination of a die having a recess adapted to receive said facing member with its front face towards the base of said recess, said recess being closely fitted by said facing member and deeper than the peripheral flange thereon, a second die shaped to fit into said recess, said second die being adapted on relative movement of said dies to enter and close the mouth of said recess, a projecting peg carried by said second die and adapted to engage and exert a positive pressure upon the back of said facing member so that the latter is forced tightly against the base of said recess, and means for injecting molten metal into said recess to form the body of the article.

2,106,997
INCINERATION OF WASTE MATERIALS
Frederick B. Schilling, Bayside, N. Y., assignor to Nichols Engineering & Research Corporation, a corporation of Delaware
Application September 14, 1936, Serial No. 100,610
8 Claims. (Cl. 110—12)

1. Process of drying and incinerating waste material to form an ash substantially free of or-

ganic matter and evolved gases free of noxious odor, which comprises passing such material successively through a plurality of zones, temporarily retaining said material in substantially horizontal layers at each of said zones while periodically agitating it and causing it to be broken into fine pieces and maintaining it in finely divided condition while advancing it through each zone and gradually from zone to zone, preliminarily warming the material in the first zone or zones, then drying the material in a succeeding zone or zones, then burning the material in a subsequent zone or zones, such drying and burning being conducted in the presence of a stream

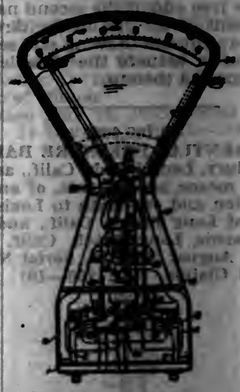


of preheated air passed countercurrent to the passage of the material and including gaseous products of combustion and vapor evolved from the drying and burning material, withdrawing said stream from a drying zone, then bringing such stream before any substantial cooling thereof, into heat exchanging relationship with a supply of air to provide said preheated air, thereafter absorbing further heat from said withdrawn stream by passing at least a substantial part thereof into contact with the material at said preliminary warming zone or zones, and then discharging such part from said warming zone or zones independently of said withdrawal of gases from the drying zone.

2,166,906
APPARATUS FOR FUSING AND SPRAYING PULVERIZED SUBSTANCES
Fritz Schori, Wetzikon, Switzerland
Application March 12, 1935, Serial No. 10,725
In Belgium March 12, 1934
12 Claims. (Cl. 91—12.2)

1. Coating apparatus comprising a flame-spraying device for fusible powder having passages therein to conduct and discharge the spray components, including a passage adapted for connection at its entrance end to a supply of air under pressure and having two branches separately leading to the point of flame discharge of the apparatus, fusible powder supply means associated with but one of said branches, and another passage separately leading to the point of flame discharge and adapted for connection to a combustible mixture supply.

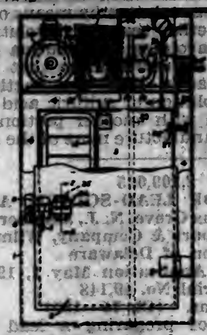
2,166,980
MIXING MACHINE
Leslie J. Staley and Frank J. White, Seattle, Wash., assignors to Fisher Flouring Mills Co., a corporation of Washington
Application June 4, 1935, Serial No. 24,864
5 Claims. (Cl. 259—11)



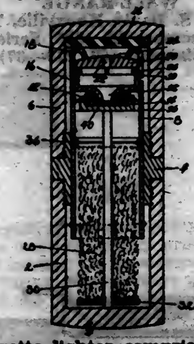
1. In a machine of the character described, a storage bin for a batch of flour, or the like, having a side opening, a continuous belt supporting the flour in the bin and operating through the side opening thereof for conveying the flour from the bin in a layer thereon to a point of delivery, a plurality of separate compartments arranged in succession along the belt and having individual dispensing means operable to deliver materials therefrom in successive layers onto the layer of flour as conveyed by the belt, and means for driving the first mentioned belt and for actuating the said dispensing means in synchronism therewith and for causing a time delay between the starting of the first mentioned belt and the dispensing means for the separate compartments.

2,169,000
METHOD OF MAKING SIGNS
Theron L. Waldo, Jr., Bath, N. Y.
Application March 3, 1936, Serial No. 66,899
1 Claim. (Cl. 41—39)

The method of forming a sign consisting of cutting a plank a predetermined length and width and smoothing faces of the plank, applying successive coats of shellac to the plank to provide smooth and highly polished surfaces for the plank and impart toughness to soft grain of the plank, washing the shellacked faces of the plank with naphtha gasoline to remove foreign matter, applying a sheet of stenciling material to a shellacked face of the plank before the gasoline has dried and thus soften the face of the stenciling sheet confronting the shellacked surface of the plank and cause the stenciling sheet to stick closely to the plank, outlining characters upon the outer face of the sheet of stenciling material and cutting through the stenciling material along outlines of the characters and removing surplus portions of the stenciling material, subjecting the plank to a sand-blast whereby portions of the plank except those covered by the stenciling material will have soft grain removed therefrom, applying a mixture of varnish stain and banana oil to the sand-blasted plank whereby the mixture of oil and varnish penetrates sand-blasted portions of the plank to fill pores of the wood and softens the stenciling material, removing the stenciling material, and coating the plank with lacquer.



2,169,001
WEIGHING SCALE
Foster V. Waltz, Toledo, Ohio, assignor to Toledo Scale Manufacturing Company, Toledo, Ohio, a corporation of New Jersey
Application February 25, 1936, Serial No. 65,588
9 Claims. (Cl. 265—57)



1. In a device of the class described, in combination, weighing mechanism comprising a lever, a load receiver mounted upon said lever, a load counterbalance, means for operatively connecting said lever and said load counterbalance, said connecting means comprising a rockably mounted means, metallic ribbons extending between said rockably mounted means and said lever, and between said rockably mounted means and said load counterbalance, and a metallic ribbon, secured to said rockably mounted means, having a weight suspended therefrom to substantially counterbalance the dead weight of said lever and said load receiver.

2,169,002
REFRIGERATOR
William W. Warren, Pittsburgh, Pa., assignor of one-half to Stanton C. Stimmel, Fox Chapel, Pa.
Application July 2, 1936, Serial No. 88,782
11 Claims. (Cl. 62—59)

1. In a refrigerator including a storage chamber, mechanical refrigerating apparatus, including a motor, for cooling such chamber, and a thermostat responsive to temperature in said chamber for controlling such apparatus, the combination of a pump driven by said motor for establishing a vacuum in said chamber, and means responsive to the pressure of the atmosphere in said chamber for controlling effective operation of said pump.

2,169,003
CIGARETTE LIGHTER
Archie M. Andrews, Greenwich, Conn.
Application August 17, 1934, Serial No. 740,363
8 Claims. (Cl. 67—7).

7. A cigarette lighter comprising a base portion, a sleeve telescopically connected with said base portion and relatively slidable, a cup structure secured to the upper end of the sleeve and having a disc of catalytic material enclosed in the upper portion thereof, means for holding said disc in place, said cup structure having a reduced nipple at the lower portion thereof and spaced downwardly from the disc for the passage of fuel to said disc, means of communication between the base portion and said nipple, a valve cooperating with the lower end of the nipple to close the same, and a coiled spring surrounding said nipple and interposed between said valve and nipple and bearing upwardly against the nipple.

2,169,004
SECONDARY ALCOHOL PRODUCTION
Francis M. Archibald, Elizabeth, and Helmuth G. Schneider, Roselle, N. J., assignors to Standard Alcohol Company
No Drawing. Application August 12, 1936, Serial No. 95,578
7 Claims. (Cl. 260—156)

1. A process for manufacturing an alcohol from an olefin which comprises contacting an olefin with an aqueous solution of sulfuric acid of 1% to 84% concentration and under a partial initial pressure of the olefin above 2 lbs. per square inch,

and a hydration temperature above 30° C., separating the aqueous solution of sulfuric acid, stripping the aqueous solution by means of steam of the alcohol and ether that are in solution and at the same time avoiding any dilution or concentration of the sulfuric acid so that it is of constant concentration and recontacting the residual aqueous solution of sulfuric acid of 1 to 84% concentration with another portion of the olefin to further manufacture more of the alcohol.

2,109,005

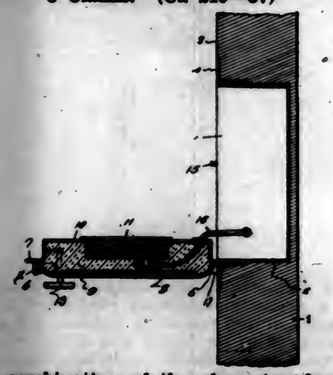
PREPARATION OF LEAD-SODIUM ALLOYS

Louis S. Bake, Penns Grove, N. J., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 1, 1935, Serial No. 19,143

5 Claims. (Cl. 75—135)

1. The process of preparing a lead monosodium alloy which comprises cooling the molten alloy to a temperature below that at which particles of the alloy tend to adhere to each other and stirring the mass during such cooling, the entire operation being carried out in the absence of moisture and oxygen.



2,109,006

WALL RANGE

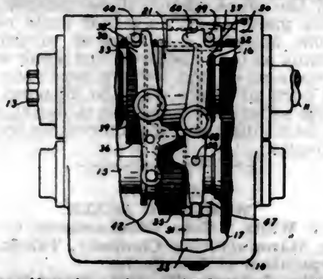
William S. Davis, Knoxville, Tenn.

Application December 18, 1935, Serial No. 55,105

3 Claims. (Cl. 219—37)

2. A combination of the character described comprising a cabinet, a closure for the front of said cabinet and hingedly secured thereto along one of its longer edges, a flange encircling said closure, a switch mounted in said cabinet and having a plunger projecting outwardly therefrom for breaking contact by engagement with said flange when the closure is in closed position, a second switch positioned on the outer face of said closure and adjacent said flange, an electrical heating unit mounted on the inner face of said closure and controlled by said switches, and means for maintaining said closure in inoperative position.

2,109,007



TRANSMISSION

Carl W. Fleas, Detroit, Mich.

Application September 27, 1935, Serial No. 42,497

4 Claims. (Cl. 74—473)

1. Mechanism for shifting gears in a variable speed transmission comprising, a shift rail supported for axial sliding movement in opposite directions, a lever supported intermediate its ends for swinging movement and having one end operatively connected to a sliding gear in the transmission, a second lever supported for swinging movement intermediate its ends and also having one end operatively connected to a sliding gear in the transmission, an abutment on said shift rail positioned for engagement with the free end of the first lever upon movement of the rail in

one direction to swing said lever in a direction to actuate the slidable gear connected thereto, and a second abutment on said shift rail engageable with the free end of the second named lever upon movement of the rail in the direction opposite the one aforesaid to swing said second lever in a direction to actuate the slidable gear operatively connected thereto.

2,109,008

DIFFERENTIAL PRESSURE BAILER

William J. Flury, Long Beach, Calif., assignor, by direct and mesne assignments, of one-sixth to Frank Halfen and one-sixth to Louis P. Brandel, both of Long Beach, Calif., and one-half to Paul Cavins, Long Beach, Calif.

Application August 26, 1935, Serial No. 37,794

8 Claims. (Cl. 166—19)

1. In a bailer, the combination of: a lower tube member having an inwardly opening check valve in the bottom thereof; an upper tube member telescoping into the top of said lower tube; a downwardly facing shoulder in said lower tube forming a valve seat; a valve member secured to the bottom of said upper tube and adapted to be engaged by said seat, the bottom of said upper tube member above said valve being ported to provide communication between said upper and lower tubes when said valve member and said valve seat are out of engagement; and an automatic check valve in said upper tube adapted to establish communication between said upper and lower tubes when the pressure in the upper tube exceeds the pressure in the lower tube.

2,109,009

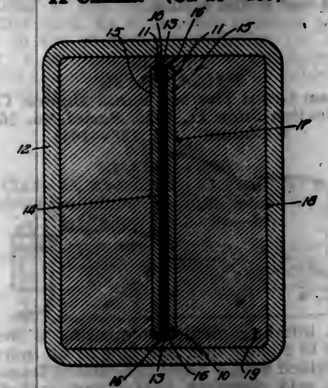
CELLULAR FORM FOR EMBEDMENT IN CONCRETE CONSTRUCTION

Homer M. Hadley, Seattle, Wash.

Application May 29, 1937, Serial No. 145,594

21 Claims. (Cl. 72—48)

1. In a cellular form for embedment in concrete, the combination of a diaphragm wall, a plurality of stringers extending through said diaphragm wall adjacent the outer periphery thereof, side walls for the cell mounted on the outer faces of said stringers, a pair of side stringers located at opposite ends of the diaphragm wall, and means for connecting the side stringers and the diaphragm wall.



2,109,010

METHOD OF MAKING LAMINATED METAL BLANKS

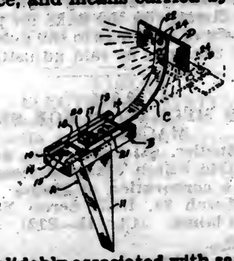
Stephen L. Ingersoll, Chicago, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

Application May 16, 1935, Serial No. 21,793

11 Claims. (Cl. 29—189)

4. The method of making laminated metal blanks, comprising the steps of forming a metal insert including an envelope having opposed side walls of a selected metal separated by a weld-preventing substance, and a slab of a different metal joined to a side wall of said envelope, forming an ingot by pouring a body of molten metal about said insert, the thickness of the selected metal adjacent the slab being less than, but the thickness of said insert at each side of said substance being at least equal to, the critical percentage of the perpendicular distance between said substance and the corresponding outer surface of said ingot to prevent breakdown of said substance by the heat from said molten metal.

2,109,011



NIGHT ROAD MARKER

James J. Joyce, Portsmouth, N. H.

Application March 2, 1936, Serial No. 66,764

4 Claims. (Cl. 33—79)

3. A road marker comprising a base including an elongate surface, an elongate normally arcuate spring, a reflector plate fixed to one end portion of the spring, the other end portion of the spring being positioned longitudinally of said surface with the convex side of the last-named end portion facing said surface, said convex side having a contour differing from the contour of said surface, and means carried by the base and

relatively slidably associated with said last-named end portion of the spring, engaging and flexing a variable length of said last named end portion against the surface so that the effective length of the spring may be varied, whereby the angular relation of the reflector with respect to the base may be varied.

2,109,012

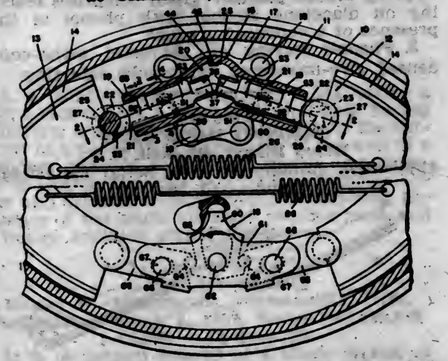
ACOUSTICAL DEVICE

Athel Ernest Neville Lawrance, Johannesburg, Transvaal, Union of South Africa

Application February 27, 1936, Serial No. 66,100

8 Claims. (Cl. 181—0.5)

1. An acoustical device comprising a sound channel the wall of which progressively varies in thickness around its cross-sectional periphery, thereby providing a progressive variation in stiffness around the cross-sectional periphery of the device.



2,109,013

BRAKE MECHANISM

Frank L. Main, Birmingham, and Charles A. Sawtelle, Detroit, Mich., assignors to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware

Application June 29, 1936, Serial No. 88,004

19 Claims. (Cl. 188—79.5)

1. In a brake mechanism, the combination with a brake drum and brake shoes engageable with

said drum and having spaced ends, of an adjustment anchor device for said shoes located between said ends, said device comprising adjustment links having the outer ends operatively connected to the ends aforesaid of the shoes, means engageable with the inner ends of the links for adjusting the latter, guides loosely receiving said links, and means acting directly on the links for preventing tilting movement of the links in the guides during adjustment of the links by said adjusting means.

2,109,014
TOP FEED MECHANISM FOR SEWING MACHINES

Charles W. Mueller, St. Louis, Mo., assignor to Lewis Invisible Stitch Machine Company, St. Louis, Mo., a corporation of Maine

Application March 24, 1937, Serial No. 132,854
4 Claims. (Cl. 112—212)

1. A 4-motion top feed mechanism for sewing machines comprising a frame arm, a drive shaft extending across the rear end of the arm, a feed lever extending longitudinally of the arm, an adjustable eccentric fixed to the shaft and having operative connection with the rear end of the lever, a feed dog mounted on the front end of the lever, and a vertically disposed supporting link between the lever and the arm and bodily shiftable towards or from the shaft from one operating position to another.

2,109,015
POLYCYCLIC PHENOLIC CONDENSATION PRODUCTS

Joseph B. Niederl and Victor Niederl, New York, N. Y.

No Drawing. Application July 5, 1935, Serial No. 29,918
6 Claims. (Cl. 260—154)

1. The process of preparing 1,3,3-trimethyl-6-hydroxy indane which comprises reacting on 2-methyl-pentane-diol-2,4 with phenol in the presence of a condensing agent.

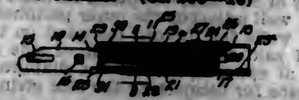
2. The process of preparing 1,1,3-trimethyl-5-hydroxy indene polymer which comprises reacting on diacetone alcohol with phenol in the presence of a condensing agent.

3. Phenols having an alkylated ortho-condensed, five-membered carbocyclic side ring.

2,109,016
CAMPING IMPLEMENT

Henry Ringer, Bloadell, N. Y.

Application January 23, 1937, Serial No. 122,045
1 Claim. (Cl. 30—143)



An implement for the purpose described including as companion separable parts, a knife and a fork, each having a handle formed with a chamber, whereby as said parts are assembled the tines of said fork enter the chamber in the handle of said knife while the blade of said knife enters the chamber in the handle of said fork, at least one of the said handles having a section which may be removed to provide access to the chamber in said handle.

2,109,017
MAGAZINE FOR RAZOR BLADES

Octavius V. Rodrigues, Passaic, N. J., assignor to Magazine Repeating Razor Company, New York, N. Y., a corporation of New Jersey

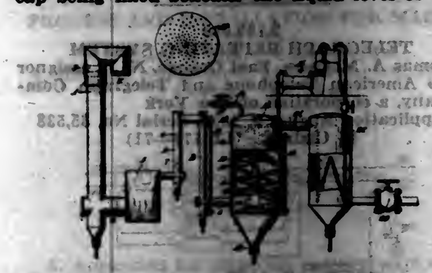
Application October 10, 1936, Serial No. 104,864
5 Claims. (Cl. 206—16)

1. A blade magazine for use with razors, comprising a barrel adapted to contain a blade holder, said barrel comprising a casing of channel section with the edges of the channel inturned leaving a gap between them and a cover plate affixed to said casing and serving as a closure for said gap, a permanent closure for one end of the casing, and a lug projecting inwardly from a wall of the casing and positioned to obstruct movement of the blade holder toward the opposite end of the casing.

2,109,018
FACIAL MASK

William Grant Thurber, Santa Monica, Calif.

Application June 11, 1935, Serial No. 26,058
2 Claims. (Cl. 128—164)



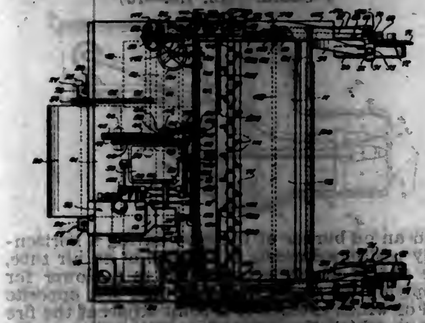
1. An inhaling means comprising a member adapted to engage over the face of an individual and provided with a nasal chamber, a frame carried by said chamber, said frame including a plate, pairs of guide members secured to said plate and extending below one edge thereof, that portion of the guide members below said plate defining a pair of openings providing communication between said chamber and the atmosphere, a pair of flap valves disposed one between each pair of guide members, trunnions carried by said valves and engaging said guide members to slidably and swingably support said valves within said frame, said plate holding said valves against swinging movement when said valves are raised within said guide members to an inoperative position behind said plate, into said chamber and means for discharging a vapor.

2,109,019
APPARATUS FOR CONDITIONING AIR

Felix F. von Wiesensky, New York, N. Y.

Application January 15, 1936, Serial No. 59,325
3 Claims. (Cl. 261—124)

1. In an air-conditioner, the combination of an air-propelling means; a conduit for the air stream running from the propelling means into a closed tank; in the air conduit a filtering device which embraces a foraminous layer of an inorganic material in a substantially filamentous form and in which chemically acting substances can be held for abating foreign substances from the air stream; a closed tank for a washing liquid in which the air conduit terminates with a perforated nozzle; above the perforated nozzle, a perforated cap which is preferably of wider extent than the perforated nozzle, the perforated cap being fixed beneath the liquid level of the

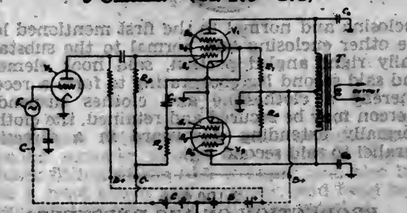


tank and so that the air stream which issues through the perforated nozzle impinges against the fixed perforated cap at a distance suitable for dissociating the foreign substances from the air; a closed pipe system running between the washing tank and an auxiliary installation for circulating a non-volatile temperature-adjusting liquid such as a calcium chloride solution chilled in the auxiliary installation for cooling the air; a conduit carrying the conditioned air from the closed tank to the interior which is to be air-conditioned.

2,109,020
ROAD PAVER

Clyde G. Abernathy, Roswell, N. Y.

Application September 21, 1934, Serial No. 744,923
21 Claims. (Cl. 94—44)

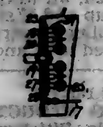


1. In a road paver of the character described, a carriage, means for movably supporting the front end of said carriage and arranged to ride on the relatively rough surface to be paved, means intermediate the front and rear ends of said carriage for depositing an excess of paving material on the surface to be paved, means for cutting off said excess to provide a smooth graded layer, means for adjusting the elevation of said last means relative to said carriage to adjust the thickness of the layer of surfacing material being laid, and means for movably supporting the rear end of the carriage comprising a plurality of rollers adapted to traverse and roll the full width of the strip laid by said depositing means, said rollers being arranged one in advance of the other so that their paths overlap, and spring means interposed between at least one of said rollers and the frame whereby both of said rollers are at all times in contact with the finished surface and the level of the finished surface is determined by the differential in height between the means supporting the front end of the carriage and said rollers.

2,109,021
ELECTRICAL SYSTEM

Edwin L. Clark, Collingswood, N. J., assignor to Philco Radio & Television Corporation, Philadelphia, Pa., a corporation of Delaware

Application March 23, 1936, Serial No. 70,595
9 Claims. (Cl. 179—171)



1. In an electrical system, a pair of space discharge devices, each having a cathode, an anode and a control element, and at least one of said devices having an auxiliary element, the control element of said one device being disposed between the cathode and the auxiliary element of said device, an output circuit comprising a winding and means for connecting one end of said winding to one anode and the other end of said winding to the other anode, another circuit, independent of said output circuit, for the auxiliary element of said one device, means for applying an input signal to the input of said one device, means for deriving a signal voltage from said auxiliary element circuit, and means for applying said last-named signal voltage to the input of the other of said devices.

2,109,022
PAINT SOFTENING TOOL

Leo A. Daniels, Collinsville, Conn.

Application August 13, 1936, Serial No. 95,872
7 Claims. (Cl. 219—29)

1. A paint softener comprising a box having a top, a closed back, a front edge, and ends having relatively angularly disposed edges to fit the surfaces of a plurality of clapboards of the wall of a building disposed in different planes and thereby to enclose the edge of a clapboard within the box and exposed to heat simultaneously with the surface of the board on which the box rests, and a heater enclosed within the box.

2,109,023
CLOTHESPIN

Daniel W. Hilderbrant, Farmersville, Calif.

Application March 4, 1937, Serial No. 129,939
1 Claim. (Cl. 24—139)

In a clothespin formed of a single strand of resilient wire, a coil intermediate the ends thereof, two substantially parallel legs extending from

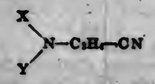
opposite ends of said coil, a substantially right angled portion extending from the end of one leg toward and beyond the other leg, said substantially right angled portion having at its end a return bend extending toward the coil forming a hook element, said second mentioned leg having at its end a guide comprising two loops, one

enclosing and normal to the first mentioned leg, the other enclosing and normal to the substantially right angled portion, said hook element and said second leg cooperating to form a recess whereby a clothesline and clothes suspended thereon may be secured and retained, the clothes normally extending downward in a direction parallel to said second leg.

2,109,024

PRODUCTION OF AZO DYESTUFFS

Karl Holzach, Carl Winter, and Bernd v. Beck, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware



No Drawing. Application March 21, 1935, Serial No. 12,128. In Germany March 22, 1934

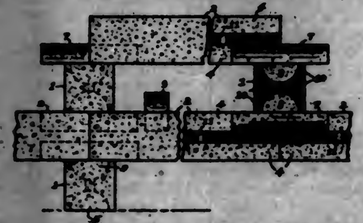
5 Claims. (Cl. 260—96)

5. Azo dyestuffs corresponding to the general formula:

A—N=N—B

in which A stands for a radical of the benzene series having a nitro group in para-position to the azo group, the radical being free from sulfonic and carboxylic acid groups, and B stands for the radical of a compound free from sulfonic and carboxylic acid groups and corresponding to the general formula:

in which X stands for a member of the group consisting of hydrogen, an arkyl, hydroxy-alkyl aryl, and aralkyl group and Y stands for an aryl group capable of coupling in para-position to the nitrogen atom attached to X and Y.



2,109,025

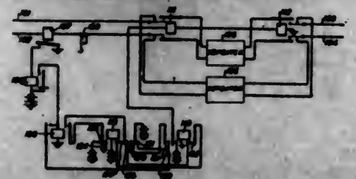
CRIBBING STRUCTURE

Richard Irvin, Pittsburgh, Pa.

Application December 7, 1936, Serial No. 114,661

4 Claims. (Cl. 61—47)

1. In a cribbing structure, the combination of a pair of stringer beams having their adjacent ends abutted against each other, a header beam disposed at right angles to said stringer beams and having an end thereof overlapping the abutting ends of said stringer beams, said beams being constructed of reenforced concrete and being provided with longitudinally extending grooves, said grooves having apertures extending through the bottoms thereof, and a T-shaped key block engaged in respective grooves for locking the adjacent ends of said stringer and header beams together.



2,109,026

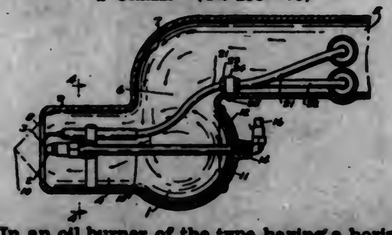
TELEGRAPH REPEATING SYSTEM

Thomas A. McCann, East Orange, N. J., assignor to American Telephone and Telegraph Company, a corporation of New York

Application August 9, 1935, Serial No. 35,538

14 Claims. (Cl. 178—71)

1. A telegraph repeater station connected between two line sections and comprising a line relay responsive to signals from both line sections, switching relay means for changing said repeater station alternately from one to the other of two transmission conditions, and relay means responsive to the reception of special switching signals by said line relay to operate said switching relay means.



2,109,027

OIL BURNER

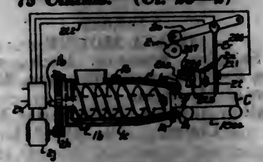
Edward J. McCullough, New York, N. Y.

Application March 25, 1937, Serial No. 132,930

1 Claim. (Cl. 158—76)

In an oil burner of the type having a horisontally positioned nozzle at the end of an air tube, one end of which is connected to a blower for supplying air under pressure, and the opposite end of which extends to a point adjacent the fire and in which the nozzle is positioned, and also in which said air tube is offset providing two sections the axes of which are parallel, and with the axis of the section connected to the blower above the axis of the section in which the nozzle is located; a ball-shaped casing positioned at the rear of the section in which the nozzle is located provided with an opening communicating with said section, and also provided with an opening in the upper side thereof communicating with the upper air supply tube section, the wall of said upper section of the said air tube terminating at a point corresponding with and tangent to the periphery of the said ball-shaped

casing on the side adjacent the nozzle, and shaped to direct air currents passing through said casing downward at the front and sides of said ball-shaped casing, and then outward through the section in which the nozzle is placed, the air passing around the inner surface of the said ball-shaped casing, and passing through the current of air passing downward therein and across the first named opening from the upper section of said air tube.



2,109,028

PROCESS AND INSTALLATION FOR MAKING POTTERY

William J. Miller, Swissvale, Pa.

Application November 4, 1931, Serial No. 573,017

75 Claims. (Cl. 25—2)

5. Apparatus for jiggering pottery ware comprising a machine for extruding heated clay slugs of predetermined form and dimensions, supports for receiving the slugs, slug advancing means, means for depositing slugs from the extruding means onto the slug advancing means, a charge segregating device to which each slug is advanced by the feeder, a jiggering unit, a movable mold support, and means for applying the segregated charges to the mold while the clay and the mold are at substantially equal temperature.

2,109,029

IGNITION APPARATUS

Edward B. Newesielski, Bloomfield, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey

Application January 18, 1937, Serial No. 121,216

5 Claims. (Cl. 123—169)

1. In a spark plug having a central spindle surrounded by a stack of insulating discs, and an enclosing shell, the combination with said discs, spindle and shell of metallic means extending through apertures in said discs for facilitating rapid transfer of heat from said discs to said shell.

2,109,030

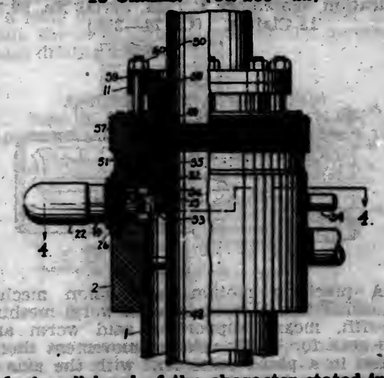
IGNITION APPARATUS

Edward B. Newesielski, Bloomfield, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey

Original application July 2, 1935, Serial No. 29,530. Divided and this application January 18, 1937, Serial No. 121,217

9 Claims. (Cl. 123—169)

1. In a spark plug having a central spindle, a wrapper of insulating material around the spindle, a stack of insulating discs surrounding said wrapper, and means for enclosing and protecting the upper edges of said wrapper, said means including a stack retaining member having a tapered bore fitting around said wrapper, and a second member having an externally tapered shank fitting within said wrapper, and also having a head above said wrapper, said head being supported by said stack retaining member.



2,109,031

FULL HOLE CASING OR TUBING HEAD

James Conn O'Neal, Beaumont, Tex., assignor to Gulf Coast Machine & Supply Company, a corporation

Application July 16, 1936, Serial No. 90,831

13 Claims. (Cl. 285—22)

1. A well head of the character stated including a tubular body threaded to engage a casing and having a full hole cylindrical interior, means at the upper end thereof for attachment to control equipment, an interior annular groove, supporting dogs housed in said groove, said dogs being linked together, and means operable from the exterior of said body to move said dogs to and from position projecting into said cylindrical interior to form a support for an inner pipe.

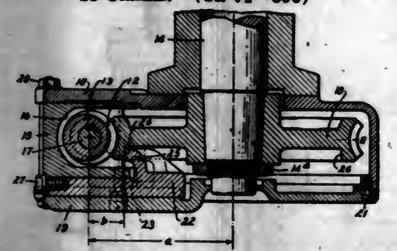
2,109,032

TOWEL RACK

Walter H. Fleiss, Ludington, Mich.

Application November 23, 1936, Serial No. 112,218

8 Claims. (Cl. 211—106)



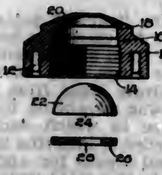
1. A towel rack comprising, a vertically positioned support adapted to be attached to a wall,

a towel rod support comprising an upper horizontal section, a downwardly and forwardly inclined section extending from the edges of said segmental section and a horizontal ledge extending from the lower edge of the inclined section, said inclined section having spaced apart bar receiving openings therein, hooks integral with and struck from said inclined section in a down-

ward and rearward direction, one at each side of each of said bar receiving openings, thereby providing pin passing openings one at each side of each bar receiving opening, and bars passing through said bar receiving openings each having a pin extending transversely through its inner end and projecting beyond the sides of the bar and located back of said hooks, as specified.

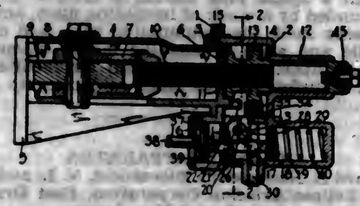
2,100,033
PRECISION MOTION-TRANSMISSION MECHANISM
Stafford M. Ransome, Rockford, Ill., assignor to Barber-Colman Company, Rockford, Ill., a corporation of Illinois
Application September 3, 1936, Serial No. 99,708
13 Claims. (Cl. 74—396)

1. A precision motion-transmission mechanism comprising a worm gear, a worm meshing therewith, means supporting said worm and worm gear for bodily relative movement therebetween in a plane coincident with the axis of said worm and transverse to the axis of said worm gear, and means for rigidly and positively maintaining the mating toothed surfaces of said worm and worm gear in engagement with an exact and predetermined working clearance therebetween irrespective of said bodily movement.



2,100,034
HANDLE AND LOCKING MEMBER FOR PASTEBOARD CONTAINERS AND THE LIKE
Morton Elias Seifer, New York, N. Y., assignor, by mesne assignments, to Stanley Patents, Inc., a corporation of New York
Application September 23, 1934, Serial No. 746,180
3 Claims. (Cl. 229—52)

2. A handle of the kind indicated comprising a blank constituting a main portion, an auxiliary portion superimposed thereon, the main portion and the auxiliary portion being formed with tapering-shaped heads and the main portion being

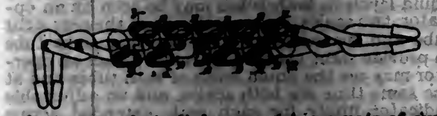


formed with lateral wings foldable down against the auxiliary portion, the heads being of greater width than the main portion at their points of juncture with the latter to provide shoulders.

2,100,035
JEWEL MOUNT
John V. Schafer, Bronson, Mich., assignor to Bronson Reel Company, Bronson, Mich., a corporation of Michigan
Application July 29, 1935, Serial No. 33,740
3 Claims. (Cl. 308—163)

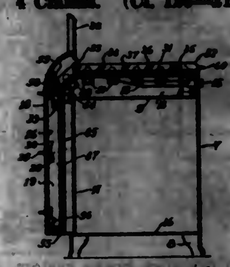
1. A jewel thrust bearing comprising: a jewel proper having a working surface and a convex surface, facing in opposite directions; a main annular support having a bore adapted to receive the entire jewel, and a conical lip at one end of said bore; said lip fitting said convex surface and being in the condition of internal stress resulting from being bulged out by axial thrust to fit said convex surface; and an annular retaining ring abutting the outer portion of said working surface; said ring being of greater diameter than said bore; said support having an enlarged bore fitting said ring; and an annular abutment shoulder joining said large and small bores.

2,100,036
AUTOMATIC SLACK ADJUSTER
Francis E. Schwentler, St. Louis, Mo., assignor to The American Brake Company, Wilmerding, Pa., a corporation of Missouri
Application November 10, 1936, Serial No. 110,110
9 Claims. (Cl. 188—203)



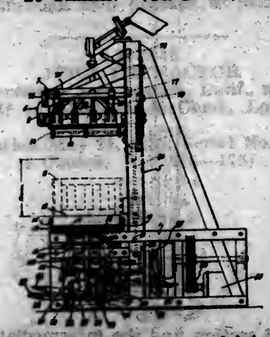
1. In an automatic slack adjuster for brake rigging, in combination, a ratchet nut for taking up slack, a pawl operative to actuate said nut, a rack movable in the direction of its length for actuating said pawl, a pinion operative to actuate said rack, and means for actuating said pinion.

2,100,037
AUTOMATIC SLACK ADJUSTER
Francis E. Schwentler, St. Louis, Mo., assignor to The American Brake Company, Wilmerding, Pa., a corporation of Missouri
Application November 17, 1936, Serial No. 111,231
12 Claims. (Cl. 188—203)



1. In an automatic slack adjuster, in combination, a longitudinally movable slack take-up element, a rotatable adjusting nut for actuating said slack take-up element, and a fluid pressure controlled motor for actuating said adjusting nut, said motor being arranged so that the longitudinal axis thereof intersects the longitudinal axis of the adjusting nut at right angles, said motor extending from one side of the nut to the other and said nut extending through operating portions of said motor.

2,100,038
CROSS CHAIN
Henry St. Pierre, Worcester, Mass.
Application May 5, 1936, Serial No. 78,571
4 Claims. (Cl. 152—14)



1. A cross chain link comprising a pair of cups on the ground engaging surface of the link, an arm extending in opposite slanting directions from each cup and constituting the tire engaging surface, said arms being flattened to prevent wear on the tire, and arms connecting the first named arms to the opposite cup.

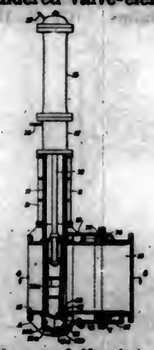
2,100,039
STOVE TOP
Howard H. Turner, Hawthorne, Calif., assignor of one-half to Ernest F. Larsen, Inglewood, Calif.
Application February 10, 1936, Serial No. 63,117
4 Claims. (Cl. 126—214)

2. In a gas or electric stove having a burner or heater area, a track leading along and away from said area, a top comprising hollow sections hinged to one another, the top movable on said track from a closed position over the burner or heater area to an open position with respect to said area, and roller carriages mounted within the hollow portions of the sections, and having rollers within said hollow portions, movable on the track.

2,100,040
BOX PRESS
Herbert E. Twomley, Riverside, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware
Application August 10, 1935, Serial No. 35,665
10 Claims. (Cl. 1—10)

1. In a power transmission, a driving member movable through a predetermined distance, a driven member, a lever, means connecting one end of said lever to said driven member, means connecting an intermediate point of said lever to said driving member, guide means engaging the opposite end of said lever to form a fulcrum about which said lever is rotated during a portion of the movement of said driving member and forming a slide bearing along which said lever slides during the remaining portion of the movement of said driving member.

2,100,041
AMUSEMENT APPARATUS
John N. Bartlett, Tonawanda, N. Y.
Application January 10, 1935, Serial No. 1,189
6 Claims. (Cl. 104—68)



1. An amusement apparatus, comprising a revolvable, substantially circular trackway including a horizontal central section and an inclined outer section, individual, motor-driven passenger carriers adapted to freely traverse said trackway in the direction of its rotation, steering caster wheels mounted on each carrier, yieldable means tending constantly to urge said wheels to a position to steer the carrier in a straight course, and passenger-controlled steering means operatively connected to said caster wheels.

2,100,042
GATE VALVE
Clifford W. Bennett and Byron H. Staats, Denver, Colo.
Application June 17, 1935, Serial No. 27,032
4 Claims. (Cl. 251—167)

1. A gate valve comprising a housing formed of a plurality of hollow sections joined in end-to-end arrangement and providing a fluid passage, a control chamber transverse of the fluid passage and

extending beyond the housing at a side thereof, a gate leaf in the chamber movable in and out of passage closing position, one section at a side of the chamber being of lesser internal diameter than the other sections, the intermediate section having an inner, annular flange of greater internal diameter than the first-mentioned section, and a third section being of substantially the same internal diameter as the flange, a tubular, externally-shouldered valve-element in the last-

mentioned section and the intermediate section, having an internal diameter corresponding to the section of lesser diameter and movable lengthwise of the passage into abutting relation with said section when the gate leaf is outside the fluid passage, the outer wall of the intermediate section engaging the shoulder on the valve-element and acting as a cylinder therefor, and means to admit a pressure fluid into said cylinder for moving the valve-element along the passage.

2,109,943

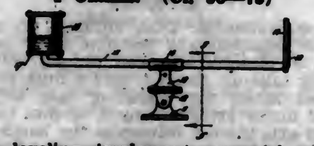
DOOR THRESHOLD

Cecil B. Davis, Kingman, Ariz.

Application September 12, 1935, Serial No. 41,076

4 Claims. (Cl. 20—67)

1. In a device of the kind described for mounting upon a conventional assembly of upright door frame and door hingedly mounted therein for horizontal movement, there being a groove formed along the bottom edge of the door, the groove being expanded laterally at spaced intervals to form spring seats, a mounting strip secured along the bottom edge of the door partially over the forward portion of the groove, an upstanding rib extending along the mounting strip and within the said groove of the door, a threshold strip disposable in a raised position in substantial parallelism with the mounting strip and disposable in a lowered position, the threshold strip being formed with a U-shaped roll along its predetermined rear edge with the bight of the roll extended into the door groove over the rear edge of the mounting strip and having a bearing thereon, bow-springs mounted freely within the spring seats of the door groove and engaging at their ends the said rib and roll of the mounting and threshold strips, the spring ends in engagement with the roll being below the other spring ends when the strips are in substantial parallelism and so disposed that the springs will be moved so that their bias is reversible, to hold the threshold strip in either the raised or lowered position, means for lowering the threshold strip as the door is closed, and separate means for raising the threshold strip as the door is opened, the said threshold strip fulcruming upon the rear edge of the mounting strip under the action of the said springs.



2,109,944

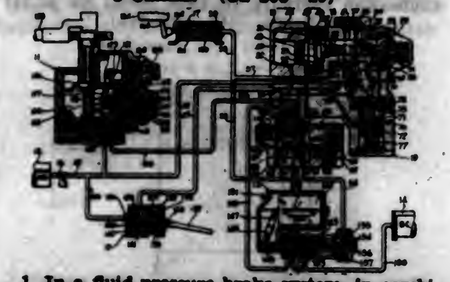
LEVELING INSTRUMENT

Price Grieve, Sigourney, Iowa

Application August 10, 1936, Serial No. 95,264

4 Claims. (Cl. 33—73)

1. A leveling implement comprising a base whereby the implement may be supported upon a vehicle, a member mounted on said base for pivotal movement relative to the base both horizontally and vertically, a sight tube at the front end of said member and a sight tube at the rear end of said member, a fluid in the sight tubes, and means for providing communication for the liquid from one sight tube to the other, said sight tubes being made of transparent material so that the liquid levels in both tubes may be seen by an operator, two scales one on each side of the rear sight tube and spaced apart from the rear sight tube to provide sight openings through which an operator may see the liquid levels of both tubes and at the same time see both scales, and an adjustable indicator finger for each scale extended across said opening from the scale toward the rear sight tube, in such position that an operator while viewing the liquid levels of both sight tubes and viewing both scales, may also in the same line of vision view both of said indicatng fingers.



2,109,945

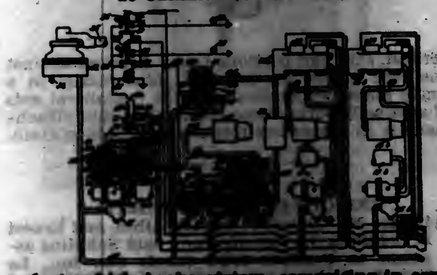
FLUID PRESSURE BRAKE

Ellis E. Hewitt, Edgewood, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application August 1, 1935, Serial No. 34,144

8 Claims. (Cl. 303—19)

1. In a fluid pressure brake system, in combination, a first valve for controlling a first communication through which fluid under pressure is supplied to effect an application of the brakes, a second valve for controlling a second communication through which fluid under pressure is also supplied to effect an application of the brakes, spring means interposed between said two valves and urging said two valves in a direction to close said two communications, and fluid pressure operated means for controlling opening and closing of at least one of said valves.



2,109,946

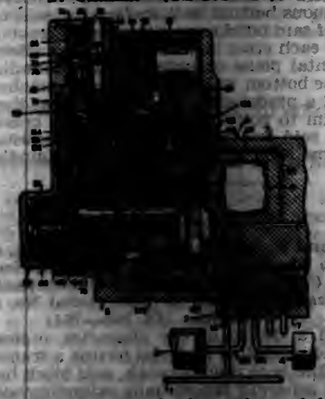
ELECTROPNEUMATIC BRAKE APPARATUS

Ellis E. Hewitt, Edgewood, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application June 2, 1937, Serial No. 145,976

16 Claims. (Cl. 303—15)

1. A vehicle brake system, comprising in combination a normally closed circuit, electroresponsive means operating on said normally closed circuit for controlling the degree of application of the brakes, a retardation controller operative upon the retardation of the vehicle to cause interruption of the said normally closed circuit and consequent operation of the electroresponsive means to control the degree of the application of the brakes, means operative automatically upon interruption of said normally closed circuit for effecting an emergency application of the brakes, and means effective as long as the application of the brakes exceeds a certain uniform degree for preventing operation of said emergency application means.



2,109,947

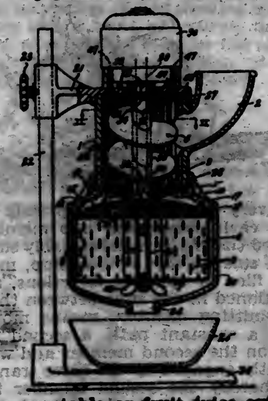
FLUID PRESSURE BRAKE

Ellis E. Hewitt, Edgewood, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application June 2, 1937, Serial No. 145,978

17 Claims. (Cl. 303—15)

6. In a fluid pressure brake equipment, in combination, a brake pipe, and an emergency valve device comprising a movable abutment subject to the opposing pressures of the fluid in the brake pipe and of the fluid in a pressure chamber, valve means operated on a predetermined increase in the pressure of the fluid supplied thereto to supply fluid from the brake pipe to a passage through which fluid may be supplied to said pressure chamber, and a valve device subject to the opposing pressures of the fluid in the pressure chamber and of the fluid supplied to said passage for regulating the rate of supply of fluid through said passage to said pressure chamber.



2,109,948

JUICE EXTRACTOR

Ben L. Lorenzen, Los Angeles, Calif., assignor of one-half to Mary O. McComb, Los Angeles, Calif.

Application May 24, 1937, Serial No. 144,429

6 Claims. (Cl. 146—175)

1. In a vegetable or fruit juice extractor, the combination of a casing, a perforated plate within the casing, a rotary feed device mounted to rotate on a substantially vertical axis above the perforated plate, a motor supported in axial alignment with the feed device, a shaft driven by the motor and extending coaxially through the feed device and through the said perforated plate, a centrifugal cage attached to the lower end of the shaft below the perforated plate for receiving the vegetable or fruit pulp forced through the said plate and operating to separate the juice from the pulp by centrifugal force, and reduction gearing located adjacent the motor for driving the feed device at reduced speed.

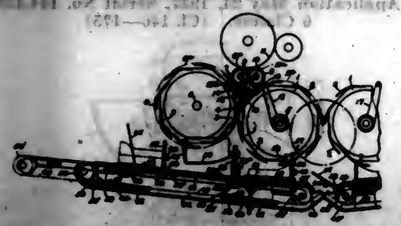
2,109,949

EXPLOSIVE

Dewitt C. McMeans, Lordsburg, N. Mex.

No Drawing. Application July 31, 1935, Serial No. 34,039. Renewed July 17, 1937

2 Claims. (Cl. 52—12)

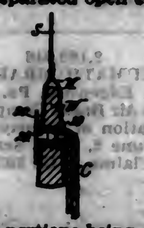


1. An explosive in the form of a granular powder consisting of the following ingredients in the proportions stated by weight:

	Parts
Potassium chlorate	35
Sugar	35
Finely divided cellulose	10
Dinitrotoluene	12
Toluene	6
Petrolatum	2

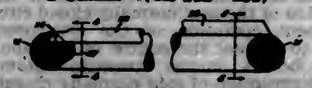
2. A method of making an explosive comprising heating dinitrotoluene, toluene and petrolatum to the boiling point, adding a small quantity

of nitric acid thereto and continuing the boiling until the nitric acid fumes have passed off, and adding to the mixture finely divided cellulose and a granulated powder made of potassium chlorate and sugar, the granulated powder and the cellulose being taken in proportion that the total mixture results in a granulated powder.



2,109,859
MECHANISM FOR DELIVERING ARTICLES IN COUNTED BUNDLES
Cecil George Quick, Donald Arthur Ball, and William Arnold Whitehead, London, England, assignors to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York
Application April 17, 1935, Serial No. 16,802
In Great Britain April 19, 1934
19 Claims. (Cl. 93—93)

1. A delivery mechanism comprising two delivery flies each comprising hub members and arms secured thereto, means rotatably supporting the flies in side by side relationship, means rotating the flies in opposite directions, a switch device positioned in the zone between the flies, a drive transmitting member, means moving the member in a constant path, a second member, abutments on the second member and which are intermittently engaged by the drive transmitting member whereby the second member is intermittently displaced, a further member, means whereby the displacement of the second member is transmitted to the further member first in one direction and then in the other direction, means interconnecting the further member and the switch device which is caused by the further member to direct a succession of products first to one fly and then a succession of products to the other fly, a receptacle associated with each fly, a stop device associated with each fly and which causes products carried by the respective flies to be deposited in superposed relation in the associated receptacle and forming a pile of products therein, a conveyor device, means moving the conveyor device successively past the receptacles, and means depositing the pile of products in one receptacle on to the conveyor and then the pile of products in the other receptacle on to the first pile of products.

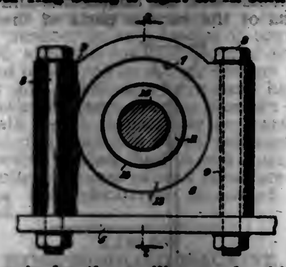


2,109,951
PULL CORD ATTACHING DEVICE
William L. Elberdy, Worcester, Mass.
Application October 29, 1936, Serial No. 108,266
1 Claim. (Cl. 156—40)

In a window curtain and pull cord combination in which the end of the curtain is provided with an eyelet inserted therethrough and in which the pull cord is looped, that improvement which consists in providing a cord-attaching device frictionally fitting said eyelet and loosely receiving said looped cord, said cord-attaching device being formed of a single piece of resilient sheet metal and having a substantially cylindrical body portion open at one end and at diametrically opposite sides to receive said cord and bridged across at the other end to retain said cord and having enlarged outer end portions formed integral with the separated open ends of said body

portion, said end portions being disposed against one face of the curtain and substantially in a single plane perpendicular to the cylindrical axis of said body portion and eyelet when said attachment is in assembled relation with said curtain.

2,109,952
REFRIGERATING APPARATUS
Sylvester M. Schweller, Dayton, Ohio, and Ernest H. Schilling, La Fayette, Ind.; said Schilling assignor to Peerless Wire Goods Co., Inc., La Fayette, Ind., a corporation of Indiana, and said Schweller assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application September 26, 1935, Serial No. 42,654
1 Claim. (Cl. 211—153)



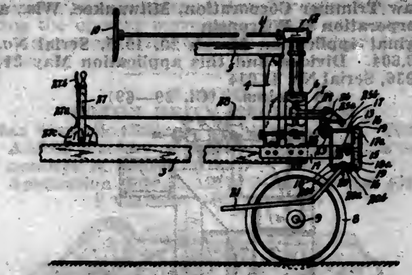
A shelf for a refrigerator cabinet including a bounding rim and a plurality of spaced apart cross members connected to opposite sides of the rim, said rim being solid and forming the sole support of said cross members, at least one of said sides of said solid bounding rim being deformed at a plurality of spaced apart points to provide notches therein, the deformations in said rim being of such character as to extend the notches from the top of said one side of said bounding rim inwardly toward the opposite side thereof and from a point inwardly of the outer edge of said one side of said rim toward the bottom thereof to form a continuous end wall surface and a relatively long continuous bottom wall surface for said notches, each of said notches receiving and supporting one end of each cross member within a portion of the horizontal plane occupied by said bounding rim, and the bottom wall surface of said notches being spaced a predetermined distance from the top of said rim to position the top of each cross member at said one side of said rim on substantially the same level with the top of said bounding rim.

2,109,953
BEARING
Raymond E. Scarles, New Britain, Conn., assignor to The Fafnir Bearing Company, New Britain, Conn., a corporation of Connecticut
Application August 24, 1936, Serial No. 97,424
8 Claims. (Cl. 308—184)

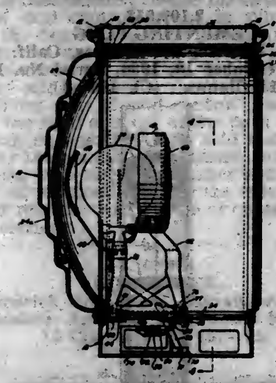
1. In a device of the character indicated, a block of insulating material having a transversely extending bore therethrough, said block having a pair of generally tangentially extending bolt holes extending therethrough and spaced from said bore, tubes in said bolt holes and bolts extending

through said tubes for securing said block to a support, an anti-friction bearing comprising outer and inner bearing rings with interposed anti-friction bearing members mounted in said bore, said outer ring being a tight fit in said bore and

held therein by the resiliency of said block, a body of sound deadening material in the bore of said inner ring, and seal means held in the bore through said block by the inherent resiliency of said block, for the purpose described.



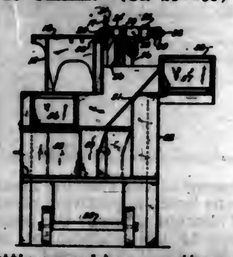
2,109,954
SWITCH
Edgar M. Sereno, Chicago, Ill., and Carl Will, Minneapolis, Minn., assignors to Tropic-Aire, Incorporated, Minneapolis, Minn., a corporation of Delaware
Application July 27, 1934, Serial No. 737,262
3 Claims. (Cl. 200—167)



1. The combination with a switch comprising a plurality of sets of contacts, a circuit closer, and a rotatable operating member for selectively moving said circuit closer into engagement with said sets of contacts, of means embodied in the construction of said member and forming a chamber, and a gravity operated element in said chamber movable upon rotation of said operating member to thereby indicate the position of the circuit closer with respect to said sets of contacts.

2,109,955
CULTIVATOR SHOVEL POSITIONING MECHANISM
Allen Spande, Mabel, Minn.
Application November 27, 1936, Serial No. 112,867
5 Claims. (Cl. 97—47)

1. In an agricultural implement having a frame, ground engaging wheels, at least one of which is steerable and means for steering said steerable wheel, the combination of a pair of arms connected at their forward ends to said implement for swinging of their rear portions laterally of said implement and adapted at their rear portions for mounting of soil-working tools thereon, with means for positioning said arms relative to said implement comprising, an element connected to said respective arms and adapted for movement to swing said arms in unison, a member connected to said steering means and movable, in response to movement thereof, in a direction generally parallel to the direction of movement of said element, and means connecting said member to said element whereby said arms will be swung to various positions responsive to movement of said steering means, said connecting means being adjustively movable lengthwise of said element whereby the positions of said arms relative to the position of said steering means may be adjustively varied.



2,109,956
STUDIO LAMP
Cecil Bartwell, West Los Angeles, and Carl E. Erickson and Jess C. Rose, Los Angeles, Calif., assignors to Motion Picture Electric Products, Los Angeles, Calif., a corporation of California
Application December 28, 1936, Serial No. 117,796
6 Claims. (Cl. 240—41.3)

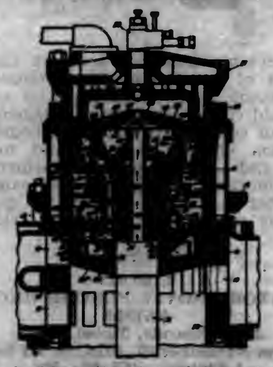
6. In an incandescent studio lamp, the combination of a light source, a condenser lens in front of said light source positioned to refract and project light rays received from said source, and a projecting reflector of a diameter greater than that of the condenser lens arranged in back of said light source and arranged to reflect and project light rays received from said light source around said lens, all symmetrically mounted on a common optical axis, and means for concurrently effecting relative movement along said axis between the light source and projecting reflector and corresponding relative movement along said axis between the light source and condenser lens in such a manner that the speed of relative movement between condenser lens and projecting reflector is greater than the speed of relative movement between the light source and condenser lens, so as to adjust the angularity of the light projected by the lens and reflector between spot and flood characteristics.

2,109,057
CUTTING MACHINE
Fredrick W. Bilker, Milwaukee, Wis., and John E. Ball, Chicago, Ill., assignors to Milwaukee Saw Trimmer Corporation, Milwaukee, Wis., a corporation of Wisconsin
Original application March 29, 1935, Serial No. 13,004. Divided and this application May 21, 1936, Serial No. 81,014
15 Claims. (Cl. 29—69)

1. In a cutting machine, a cutter, a chute extending beneath and across the plane of action of said cutter, a cabinet supporting said cutter and said chute and having a confined space communicating with said chute, and an element movable in said space for effecting controlled distribution of the cuttings delivered from said chute either cumulatively upon said element or freely out of said space.

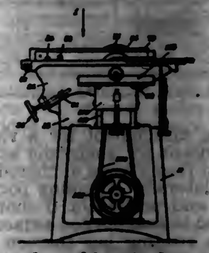
2,109,058
CEMENTING PLUG
John F. Rice, Los Angeles, Calif.
Application October 10, 1936, Serial No. 105,669
11 Claims. (Cl. 166—1)

1. A cementing plug including a piston, a cup on the piston, a sealing packer below the piston, and a flexible connection extending from the piston to the sealing packer whereby the piston and sealing packer are coupled together.



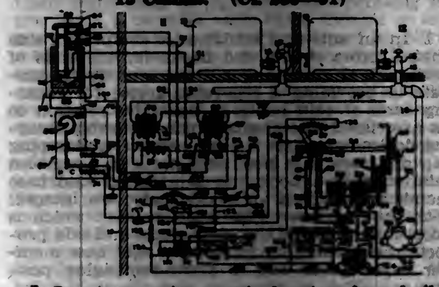
2,109,059
INFANT'S SYRINGE
Myra Emory Burke, Madison, Wis.
Application August 26, 1935, Serial No. 37,937
1 Claim. (Cl. 128—227)

An infant's rectal syringe comprising an open-top fluid container having attached at its lower end a flexible conduit of substantial length and relatively small substantially uniform diameter, said conduit terminating in an open end forming a flexible syringe nozzle, and an insertion-limiting enlargement formed on said conduit at a determinate position approximately three inches from the nozzle end, the dimensions and relative proportions of the various parts of the syringe



being such as to permit a maximum hydrostatic pressure head of not more than approximately seventeen inches to be applied in administering enemata, said syringe having a one-piece, inseparable, integral structure of the same flexible material throughout.

2,109,060
CROSS HEAD AND PISTON ROD AND PISTON CONSTRUCTION
Edward S. Dennison, New London, Conn., assignor to Electric Boat Company, Groton, Conn., a corporation of New Jersey
Application February 25, 1937, Serial No. 127,670
13 Claims. (Cl. 123—176)

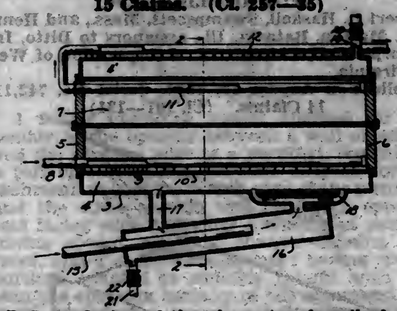


1. In a double acting internal combustion engine, a cylinder, a piston operating therein and provided with passages for circulation of cooling fluid, a cross-head having a socket in its upper end, a piston rod operatively connecting said piston and said cross-head and seating in said socket with its lower end in sealing contact with the bottom of said socket, said piston rod being provided with lengthwise inlet and outlet passages opening through its lower end and communicating with said piston passages, a securing member secured upon said piston rod adjacent and spaced from the upper end of said cross-head, said member being provided with an outwardly projecting flange having its upper face convex and of a spherical curvature, a clamping member having its lower face curved conformably to and seating upon the upper face of said flange, said clamping member being movable relative to said securing member about the common center of curvature of said surfaces, means securing said clamping member to and forcing it toward said cross-head effective for maintaining the lower end of said piston rod in sealing contact with the bottom of said socket, said cross-head having inlet and outlet passages opening through the bottom of said socket respectively in register with said piston rod inlet and outlet passages, means for conducting cooling fluid to and from said inlet and outlet passages of said cross-head, and a connecting rod operatively connected to said cross-head.

2,109,061
WOODWORKING MACHINE
Henry J. Dietrich, Banning, Calif.
Application October 2, 1936, Serial No. 43,209
5 Claims. (Cl. 144—129)

1. In a wood working tool, a machine frame having upwardly and rearwardly sloping guides, a front table adjustably mounted on said guides for elevation and rearward motion, the front table having a table top with a U-shaped opening therein, a rear table having a rear table top vertically adjustable in the machine frame, the rear table top fitting in said U-shaped opening, the front table top having a rear edge at said opening, and the rear table top having a front edge at said opening, a mandrel shaft journaled in the machine frame and having a mandrel with means for attaching wood working cutters thereto, the cutters being adapted to operate through the opening of said edges, and means to adjust the rear table top horizontally to vary the distance between said edges.

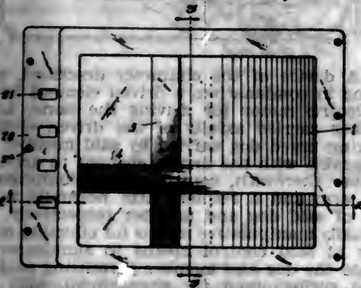
2,109,062
TEMPERATURE CONTROL SYSTEM
George H. Fisher, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application September 5, 1935, Serial No. 39,256
15 Claims. (Cl. 236—91)



5. In a temperature control system for a building, the combination of valve means for controlling the supply of heating fluid to the building, means responsive to outdoor conditions for opening or closing said valve means, and means responsive to outdoor conditions for gradually limiting the opening movement of said valve means in accordance with changes in outdoor conditions.

2,109,063
MOTOR DRIVE MECHANISM
Max Garbell, Chicago, Ill., assignor to Victor Adding Machine Company, Chicago, Ill., a corporation of Delaware
Application May 2, 1937, Serial No. 140,422
9 Claims. (Cl. 192—.03)

1. A device of the character described, comprising in combination, a driven element having an electric motor for driving the same, and a member carried axially of the driven element, a spring-urged dog carried by said member and engageable with the driven element to drive the member therewith, control means comprising a rigid arm and a resilient arm normally in the path of said dog and member respectively, and manually manipulative means for effecting movement of said control means to simultaneously release the dog and member permitting said dog to be spring-urged for engagement with said driven element for causing the turning movements of said member with the driven element, the resilient arm of said control means serving to hold the rigid arm out of the path of said dog by sliding engagement with said member when moved by the manipulative means and to form a cushioning stop for said member and retain the dog out of engagement with the driven element in timed relation with a cycle of operation of the driven element.

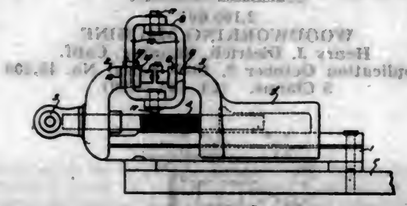


2,109,064
CONDENSER
Fredrick Gettelmann, Milwaukee, Wis.
Application April 20, 1936, Serial No. 75,260
15 Claims. (Cl. 257—35)

7. In a device of the character described, the combination with an annular reservoir and means closing the ends of its interior cavity to provide a chamber for coolant, said reservoir and chamber having a common partition wall, of means entering said coolant chamber and comprising a pipe arranged to direct coolant toward

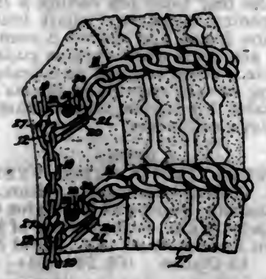
a portion of said wall below the normal level of condensate in said reservoir, a conduit below the level of condensate in said reservoir having its ends in communication with said reservoir and arranged with one of its ends directed toward said partition wall portion, a supply pipe operatively connected to deliver condensable gas to said conduit in a direction to induce a flow of said gas and condensate toward said wall portion, means for withdrawing condensate from said reservoir, and means for withdrawing coolant from said chamber, said coolant withdrawal means having openings arranged to deliver at least a portion of the withdrawn coolant over the exterior surface of the reservoir to provide additional cooling by evaporation therefrom.

2,100,065
DRAFTING APPARATUS
Fern D. Haselton, Newark, N. J.
Application March 5, 1937, Serial No. 129,208
5 Claims. (Cl. 33—86)



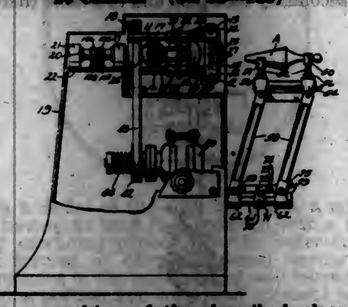
5. Apparatus of the character described comprising a frame having a bed, two pairs of channel guideways in superposed relation at one side of said bed in planes parallel to each other and to the plane of the bed, the guideways of each pair being parallel to each other and at right angles to the guideways of the other pair and the channels of each pair of guideways facing each other, and a ruler mounted in each pair of guideways and comprising a strip of material having cross-heads at its ends slidable within the respective channels.

2,100,066
ASSEMBLING AND LAYING MASTER SHEETS FOR DUPLICATION
Robert R. Haskell, Swampscott, Mass., and Henry J. Merten, Batavia, Ill., assignors to Ditto, Incorporated, Chicago, Ill., a corporation of West Virginia
Application August 30, 1934, Serial No. 742,116
14 Claims. (Cl. 101—131)



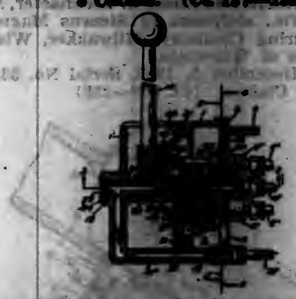
1. A method of duplicating selected portions of records formed on a plurality of master sheets, which comprises assembling and securing together the opposite ends of the master sheets in overlapping relationship to expose only the selected portions of the records thereon on one side of the assembly, laying the assembly upon a duplicating surface, stripping the assembly from said surface, and thereafter applying a copy sheet to said surface.

2,100,067
RIVETING DEVICE
Howard Milton Johnston, Toronto, Ontario, Canada, assignor to Massey-Harris Company, Limited, Toronto, Ontario, Canada
Application December 19, 1936, Serial No. 116,832
4 Claims. (Cl. 81—33)



1. A riveting attachment for a vise comprising a frame, means for anchoring said frame to a vise jaw, said frame when anchored to the vise jaw having a laterally extending portion, a riveting jaw on said portion, a U-shaped bearing member secured to said portion adjacent its outer end, a lever, a riveting jaw thereon and means for pivotally mounting said lever on said bearing member.

2,100,068
ANTISKID DEVICE
Blanch T. Kinnear, Still River, Mass.
Application March 6, 1937, Serial No. 129,463
5 Claims. (Cl. 152—14)



1. In an anti-skid contrivance comprising side chains, cross chains and hooks for the ends of said cross chains, that improvement which consists in providing a separable device for securing each of said hooks in operative relation to its associated side chain, which separable securing device comprises a base member, a clamping cap and means to hold said parts in assembled relation with a hook and side chain, said base member having an anti-skid projection integral with that portion of the base member which is adjacent the end of the cross chain and said projection extending outward from said base member beyond said cap to ground-engaging position.

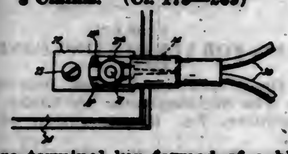
2,100,069
SANDING AND POLISHING MACHINE
Carl J. Lippold, Wauwatosa, Wis., assignor to J. M. Nash Company, Milwaukee, Wis., a corporation of Wisconsin
Application June 24, 1935, Serial No. 28,050
26 Claims. (Cl. 51—125)

1. In a machine of the described class, the combination with a pulley support, a set of pulleys mounted thereon, an endless belt mounted for travel about said pulleys, and means for rotating the pulley support about an axis intersecting the belt between two of said pulleys, said support being provided with a relatively fixed belt supporting pad also intersected by said axis, whereby work may be pressed against the belt along said axis for polishing operations by the portion of the belt traversing said pad.

2,100,070
AIR CONTROL VALVE FOR GEAR SHIFTS
Philip MacKenzie, Oakland, Calif.
Application April 7, 1936, Serial No. 73,091
8 Claims. (Cl. 137—139)

1. A fluid control valve for motor vehicle gear shift comprising a flat plate having a plurality of spaced valve ports arranged therein for respectively connecting to pipe lines for operating the gear shift, a movable valve block slidable on said plate and having an air port arranged for alignment with one at a time only of any of said ports upon sliding of the block, a hand lever, means supporting and guiding said hand lever for bodily arcuate movement as well as forward and backward movement in planes transversely of said arcuate movement, and means forming an operative connection between said lever and said valve block whereby the block may be shifted to align its air port with one at a time only of any of said ports selectively as said hand lever is moved to various positions along the paths indicated, the construction including means always insuring the positive intermediate alignment of the valve block air port with one in particular only of said valve ports of the plate during its shifting from any of the other ports to another, and means continuously connecting the slidable block with a source of operating fluid.

2,100,071
MEANS FOR VENTILATING CONFINED SPACES
Robert Henri Mautsch, Brussels, Belgium, assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application February 12, 1935, Serial No. 6,319
In Belgium March 30, 1934
15 Claims. (Cl. 98—13)



1. In combination, a fresh air conduit, a plurality of nozzles open at one end to said conduit and at the opposite end to space and disposed to direct air received from said conduit in an oblique downwardly direction into said space, a casing around said nozzles forming a chamber open to said space through a plurality of lateral openings in said casing, a member in each of said nozzles movable into the path of flow of air through said nozzles for diverting air from said nozzles into said chamber whereby a flow of air in a lateral direction is obtained through said lateral openings into said space, and means operable manually for individually adjusting the position of said members in said nozzles for varying the amount of air diverted from said nozzles into said chamber.

2,100,072
WALL CONSTRUCTION
David V. Nelson, Chicago, Ill.
Application February 18, 1937, Serial No. 126,344
2 Claims. (Cl. 72—46)

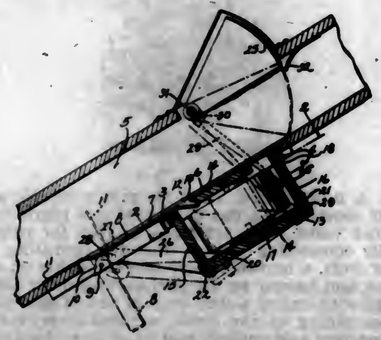
1. Sound excluding means adapted for assembly in the opening between a wall or ceiling and the abutting edge of a partition, comprising a pair of cooperating elements adapted for attachment, one on the facing edge of the partition and the other on said wall or ceiling opposite said facing edge, including a channeled element having spaced, opposing, channel-defining surfaces, and a cooperating element having spaced portions adapted to slidingly interfit with and abut the opposing surfaces of the channeled element whereby to permit relative separational movement between the elements, and a resilient strip of felt-like material wrapped about the said cooperating element and having its opposed edges held each by and between one of said portions of the cooperating element and one of said surfaces of the channeled element.

2,109,073
WIRE TERMINAL LUG
Marvin B. Nieman, St. Louis, Mo.
Application February 11, 1935, Serial No. 5,921
3 Claims. (Cl. 173—269)

2. A wire terminal lug formed of a blank of sheet metal notched at opposite edges and foldable transversely of a line passing through said notches into three approximately equal sections, the resulting portions of the blank at one side of the defining notches being rolled over and folded down upon the medial section, said medial section having an aperture therethrough, each fold having an aperture therethrough, said apertures being aligned to form a three-fold binding post end with sleeves at the bights of the folds for engaging the stripped extremities of two wire conductors, the said sleeves being held against spreading by a binding post engaged in said apertures and the end portions of the blank at the other side of the defining notches being rolled and folded down over upon said medial section to form sleeves for engaging the insulation covered ends of the wires immediately back of the said stripped extremities thereof.

2,109,074
VEHICLE SPRING SUSPENSION
Robert W. Nilson, Toledo, Ohio, assignor to The Mather Spring Company, Toledo, Ohio, a corporation of Ohio
Application October 12, 1936, Serial No. 105,369
2 Claims. (Cl. 267—19)

1. Vehicle stabilizing means of controlled frequency resistance embodying a body member, a wheel supporting member shiftable relatively to the body member, a radius rod pivotally connected as a link between the members, and a leaf spring having a free end and a bearing seat therealong, said rod having an opposing continuous seat, said rod and said spring being substantially parallel throughout their normal operation and said seats being so constructed that the vertical shifting between the members causes a greater extent of shifting of the contact point between said seats, thereby changing the effective spring length.

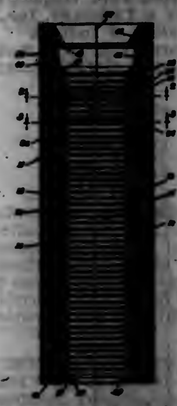


2,109,075
DEVICE FOR CLEANING TANKS AND THE LIKE
Harold M. Ruth, Huntington Park, Calif., assignor to The Pyrate Corporation of Nevada, a corporation of Nevada
Application May 26, 1933, Serial No. 672,927
Renewed September 19, 1934
11 Claims. (Cl. 299—67)

11. A tank cleaning device of the class described embodying: a main feed pipe, means for vertically supporting said main feed pipe; a secondary feed pipe rotatably mounted on the lower end of said main feed pipe; a nozzle feed pipe mounted on said secondary feed pipe at an angle thereto; a nozzle member rotatably mounted on said nozzle feed pipe; a liquid motor supported by said secondary feed pipe and rotatable therewith;

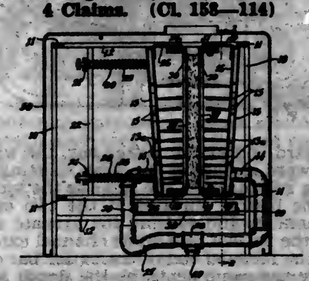
means for delivering power liquid to the motor from the secondary feed pipe; means operated by said liquid motor for rotating said nozzle member; and means operated by the action of the liquid motor for rotating the secondary feed pipe relative to the main feed pipe in timed relation with the rotation of the nozzle.

2,109,076
ELECTROMAGNETIC SEPARATOR
Roswell H. Stearns and Elmer C. Kiekhaefer, Milwaukee, Wis., assignors to Stearns Magnetic Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin
Application December 5, 1935, Serial No. 52,972
4 Claims. (Cl. 209—228)



1. In an electromagnetic separator, the combination with a plurality of polar core elements, of means permanently connecting said elements and having a limited flux carrying capacity just sufficient to short circuit the residual magnetism in said elements, a winding on one of said elements, an armature core member movable to and from one side of the several elements to complete the flux path therethrough when the winding is energized, and a gate connected to said armature core member to be actuated thereby.

2,109,077
MEANS OF MIXING A PLASTIC MATERIAL
Halver R. Straight, Adel, Iowa
Application January 18, 1935, Serial No. 2,010
7 Claims. (Cl. 259—100)



1. In a device of the class described, a mixing knife having its back face provided with a rearwardly extending portion near its outer end, a shank formed of ductile material having one end mounted in the inner end of said rearwardly extending portion and supported adjacent to the back side of the inner end of said knife, the inner end of said shank extending inwardly of the inner end of said knife.

2,109,078
MEANS FOR CASTING CLAY PIPE
William Washo, Los Angeles, Calif., assignor, by direct and mesne assignments, to Pacific Clay Products, a corporation of California
Application December 4, 1935, Serial No. 52,796
4 Claims. (Cl. 25—129)

1. In a device for casting clay pipe, a lower tubular mold formed integral having a lower internal shoulder sloping inwardly and downwardly and a lower outward flare below the shoulder to the bottom of the lower portion of the mold, an upper mold section having a transverse joint with the lower mold connected by interfitting recesses and dowels, the upper mold having a plurality of vertical joints with interconnecting recesses and dowels, the upper mold having a collar forming enlargement with a lower shoulder sloping outwardly and upwardly, an annular surface thereabove having an outward slope, an upper shoulder sloping upwardly and inwardly and having a funnel surface sloping upwardly and outwardly from the inner edge of the second shoulder, the upper and lower molds being relatively thick compared to their internal diameter and formed of a water absorbent material, the upper funnel surface being adapted to operate as a guide for a clay trimming tool at the top of the mold and the lower flared surface being adapted to act as a guide for a trimming tool at the lower part of the mold.

2,109,079
BROILING APPARATUS
Kenneth O. Zeigler and Jacob B. Zeigler, Salem, Ohio
Application August 10, 1935, Serial No. 35,640
4 Claims. (Cl. 158—114)

1. A spaced pair of hollow, flat, upright gas burners adapted to receive a food rack therebetween, each burner having a plurality of apertures in its inner wall, the spacing of the apertures increasing toward the top of the burner, and staggered baffle plates located one above the other within said hollow burner and having their ends alternately spaced from opposite edges of the hollow burner, and means for admitting gas to the lower portion of the burner.

2,109,080
FURNITURE FRAME
Adolf Bergmann, Berlin-Charlottenburg, Germany
Application September 12, 1934, Serial No. 743,663
In Germany September 18, 1933
5 Claims. (Cl. 155—191)

1. A bent furniture frame comprising an ornamental outer flexible cover, an inner flexible cover, and an initially plastic core within the inner cover and adapted when set to hold the frame in substantially rigid condition, said inner cover forming a mold for the initially plastic material.

2,109,081
CUTTER BAR
Charles L. Bowman, Canton, Ohio, assignor to The Bowdil Company, Canton, Ohio, a corporation of Ohio
Original application May 24, 1935, Serial No. 23,211. Divided and this application December 12, 1935, Serial No. 54,098
4 Claims. (Cl. 262—33)

1. In a mining machine, a solid cutter bar having a guide channel in its opposite edges and a deep channel extending around the forward end of the bar, said deep channel having a bottom surface disposed angularly with reference

to the bottom surface of the two opposite guide channels, a wear resisting member having a forward arcuate surface and a rearward engaging surface to engage the angular bottom surface of the deep channel, transversely extending means engaging the wear resisting member and the sides of the deep channel for securely mounting the wear resisting member in the deep channel upon

the forward end of the cutter bar, the width of the rearward surface of the wear resisting member being substantially the same as the width between the bottom surfaces of the two opposite guide channels and causing the arcuate surface to form the bottom of a guide channel extending around the forward end of the cutter bar of substantially the same depth as the depth of each of the two opposite guide channels.

2,109,082

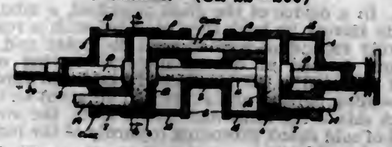
MINING MACHINE CUTTER BAR

Charles L. Bowman, Canton, Ohio, assignor to The Bowdil Company, Canton, Ohio, a corporation of Ohio

Application June 13, 1936, Serial No. 85,140

3 Claims. (Cl. 262—33)

1. In a mining machine utilizing a cutter chain, a cutter bar having two opposite edges and a forward arcuate end over which the cutter chain passes, said cutter bar having two spaced longitudinal wall portions disposed along each of the said opposite edges of the cutter bar, to form a guide channel for the cutter chain, said cutter bar having a forward wall portion integrally connected to the forward end of the cutter bar and disposed along one side thereof, said forward wall portion having stepped surfaces and a stepped edge between the said surfaces, the other side of the forward end of the cutter bar having a recess, a detachable forward wall portion connected to the forward end of the cutter bar and disposed upon the said other side of the cutter bar and having its rearward part engaging the said recess, said detachable wall portion having stepped surfaces and a stepped edge between said surfaces, a detachable wear resistance block detachably positioned intermediate the said forward wall portions and between the lowermost stepped surfaces, the rearward edge of the detachable wear resistance block coinciding with the stepped edges of the said forward wall portions, and means for detachably connecting the detachable wall portion and the detachable wear resistance block to the forward end of the cutter bar, the two lowermost stepped surfaces of the two forward wall portions and forward surface of said wear resistance block forming a guide channel around the forward end of the cutter bar and in alignment with the guide channel formed in each edge of the cutter bar, the edge of the said recess and the rearward edge of the detachable wear resistance block constituting angular edges for constraining the detachable forward wall against lateral movement.



2,109,083

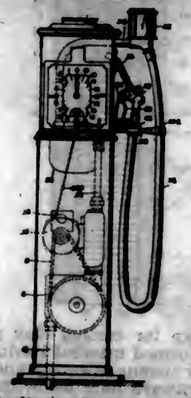
HOLLOW CRANKSHAFT

Donald J. Campbell, Spring Lake Township, Ottawa County, Mich., assignor to Campbell, Wyant & Cannon Foundry Company, Muskegon Heights, Mich., a corporation of Michigan

Application December 26, 1933, Serial No. 703,943

7 Claims. (Cl. 22—200)

1. The method of producing a crankshaft which consists in casting the same in a mold, and casting bars connecting crank portions of the shaft opposite to crankpin portions of the shaft, causing uniformity in shrinkage on cooling.



2,109,084

DISPENSING APPARATUS

William M. Carroll, Fort Wayne, Ind., assignor to S. F. Bowser & Company, Inc., Fort Wayne, Ind., a corporation of Indiana

Application February 2, 1935, Serial No. 4,675

34 Claims. (Cl. 221—95)

1. A liquid dispensing apparatus comprising means forming a delivery conduit having a freely suspended portion, means for delivering liquid through said conduit, said means including an electric pump and a switch for starting and stopping the pump, a member secured to said conduit below its point of suspension, means operatively connecting said member with said switch so that by pulling said conduit the switch will be moved to starting position, means for maintaining the switch in such starting position on release of the pulling action on said conduit, and manually shiftable means actuatable from the delivery end of said conduit for restoring the switch to stopping position without pulling action on said conduit.

2,109,085

SICKLE CUSHIONER

Gus E. Chilstrom and Abel Thompson, Paullina, Iowa

Application February 26, 1936, Serial No. 65,832

2 Claims. (Cl. 56—306)

1. A sickle cushioner comprising a bracket attached to the sickle blade member and rearwardly thereof, a downwardly turned lip attached to the bracket, compression means bearing against said lip including a pair of helical springs on each side of the lip, said lip having an opening, a rod passing through said opening and said springs and attached to the stationary portion of the sickle, means for adjusting tension of the springs including a pair of slidable collars receiving said rod including set screw locking means for locking the collars against the rod, said structure attached toward the outer end of the sickle.

2,109,086

GRINDING INSTRUMENT FOR USE IN DENTAL WORK

Hilaire P. Coussement and Floris Cappette, Roubaix, France

Application May 15, 1936, Serial No. 79,974

In France May 17, 1935

2 Claims. (Cl. 32—59)

1. In a grinding tool, a heat-baked head including a metallic support and comprised of a mixture of commimuted glass, sodium silicate binder, and a temporary gum-lac binder carbonized during the baking of the head, said charred mass being uniformly distributed in the head to lower the resistance of the baked binder.

2,109,087

PROCESS OF IMPROVING THE ELECTRICAL RESISTANCE OF ANIMAL FIBERS

Alfred Cecil Geoffrey, Toronto, Ontario, Canada, assignor to Dominion Silk Mills Limited, Toronto, Ontario, Canada

No Drawing. Application June 12, 1936, Serial No. 84,978

13 Claims. (Cl. 28—58)

1. A process of treating animal fibers to increase their electrical resistance which consists in subjecting the material to the action of an atmosphere of dry steam.

2,109,088

MACHINE FOR CUTTING, EMBOSSING, AND PRINTING SHEETS OF PAPER AND CARDBOARD

Salomon Levin, Lille, France

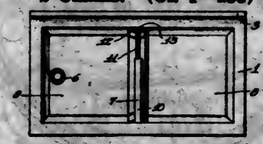
Application November 2, 1936, Serial No. 108,990

In France October 31, 1935

4 Claims. (Cl. 101—237)

1. In a machine of the character described, a frame, a table pivoted to said frame, a paper embossing die mounted on said frame and co-operating with corresponding depressions in the table, cutters angularly secured to the table and adapted to co-act with the edges of the die for paper cutting purposes, a spring pressed plate pivoted

to the frame and extending through the table for paper centering purposes, a paper ejector movable through apertures of the die, and cams operable to operate the plate and ejector in turn upon operation of the pivoted table for cutting and embossing the paper inserted on the die.



2,109,089

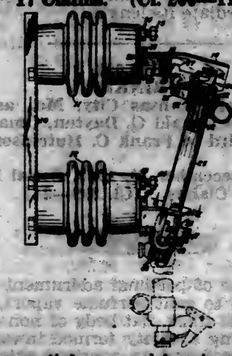
SINK PARTITION INSERT

Seoris M. Moyes, Stockton, Calif., assignor of two-fifths to Eugene M. Stagnaro, Stockton, Calif.

Application March 23, 1936, Serial No. 70,282

2 Claims. (Cl. 4—183)

1. An improved sink partition insert comprising a partition wall member with a flexible flange in contact with the sink walls, the aforesaid flange being concave, which forms a cavity between the outer contact edges of the flange, thus forming a means of making a water tight joint by the formation of a vacuum between the flange edges upon pressing the insert into position.

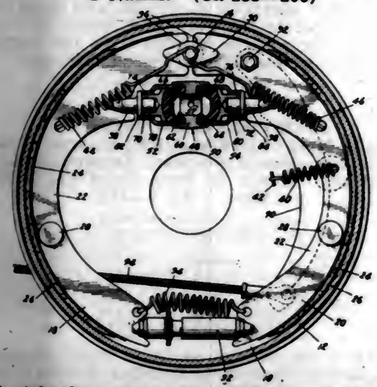


2,109,090

HIGH DUTY FUSE SWITCH

Ralph R. Pittman and Carroll H. Walsh, Pine Bluff, Ark.

Application January 16, 1937, Serial No. 120,963



17 Claims. (Cl. 200—114)

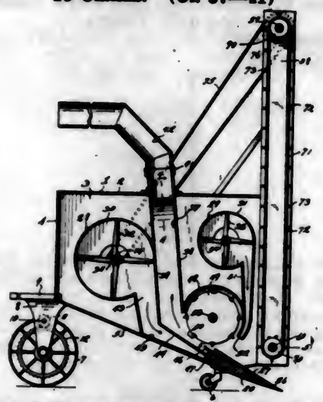
1. A fuse switch comprising insulating means having mounted thereon spaced insulated upper and lower terminal members, a fuse cartridge pivoted at its lower end on the lower terminal member, a fuse link within said cartridge electrically connecting the terminal members, latch

means dependent upon tension in said fuse link for maintaining the electrical connection, an opening at the upper end of said cartridge and a valve longitudinally movable along the axis thereof for closing said opening, and detent means carried by said valve, said detent means being arranged to prevent movement of said latch means in response to the rupture of said fuse link when said opening is open.

2,109,091
BRAKE
Carl Press, South Bend, Ind., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application October 19, 1936, Serial No. 106,375
4 Claims. (Cl. 188—106)

1. A brake comprising a fixed support, a rotatable drum associated therewith, a pair of friction elements arranged on the support for cooperation with the drum, a primary actuating means for the friction elements including a floating motor suspended between the friction elements, and a secondary actuating means for the friction element comprising mechanical linkage including a lever pivoted on one of the elements and the motor movable bodily as a unit of the linkage, said lever being pivoted near one end of said element and extending to a point adjacent the other end of said element and engaging said motor intermediate its length.

2,109,092
TRINKET
Walter H. Bell, Kansas City, Mo., assignor of one-third to Donald G. Dayton, Omaha, Nebr., and one-third to Frank C. Hutchison, Kansas City, Mo.
Application December 16, 1935, Serial No. 54,617
4 Claims. (Cl. 299—24)

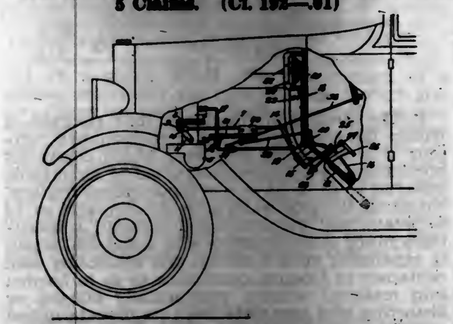


1. An article of personal adornment or pocket piece adapted to emit perfume vapors, comprising a relatively thick, flat body of non-absorbent material having a cavity formed inwardly from one face thereof and an aperture extending inwardly from the opposite face thereof into communication with said cavity; a sheet of absorbent material overlying the bottom of the cavity and forming a bottom for the said aperture; and a plate within the said cavity to hold the sheet of absorbent material in position and having its outer surface in an arc concentric with an arc having therein that portion of the face of the first mentioned face of the said body which circumscribes the plate.

2,109,093
PACKAGING SLICED CHEESE
Joseph Rossman and Charley L. Wagner, Rothschild, Wis., assignors to Marathon Paper Mills Company, Rothschild, Wis., a corporation of Wisconsin
No Drawing. Application February 15, 1937, Serial No. 125,934
3 Claims. (Cl. 99—178)

1. A method of packaging sliced cheese comprising the steps of assembling slices of cheese in face to face relation, completely enclosing said assembled slices in a film made of wax-rubber composition having an initial viscosity of 8,000 secs. (Scott viscosimeter at 90° C.), applying pressure to bring the said film into intimate contact throughout the external surface of the said assembled slices and sealing the overlapping portions of the film to exclude access of air to said cheese slices.

2,109,094
ROADWAY SNOW EXCAVATOR
Ellis K. Smeal, Morrisdale, Pa., assignor of one-half to John Little, Philipsburg, Pa.
Application January 7, 1937, Serial No. 119,512
13 Claims. (Cl. 37—41)

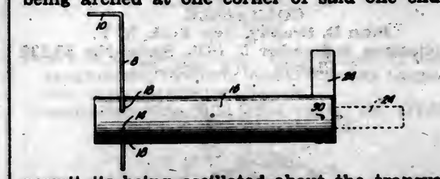


1. A snow excavator, comprising a wheel supported body, a plow carried by the body in a position relative to the ground to scrape up snow therefrom, receiving means at the rear of said plow into which said snow passes from the plow, a carry-off pipe leading from said means, and means for delivering blasts of air into said receiving means against both the top and under side of a body of snow passing from the plow into the receiving means.

2,109,095
INSECTICIDAL OIL COMPOSITION
William Hunter Velck, Watsonville, Calif., assignor to California Spray-Chemical Corporation, Berkeley, Calif., a corporation of Delaware
No Drawing. Application June 30, 1934, Serial No. 733,251
4 Claims. (Cl. 167—28)

2. A phytonomic insecticidal oil composition consisting of a mineral oil in which is dissolved less than about 3% by weight, relative to the oil, of alkali salts of sulfonic acids from petroleum and an organic liquid of relatively low molecular weight which is both oil and water soluble to a high degree in an amount adequate to lower the interfacial tension between the composition and water to the point that emulsification may be effected without the aid of any additional emulsifying agent.

4. A phytonomic oil composition consisting of a mineral oil containing in solution less than 3% by weight sulfonic salts from petroleum and about 1% of acetone.

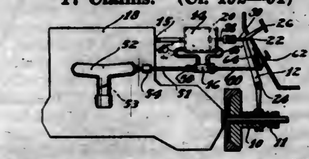


2,109,096
AUTOMATIC CLUTCH RELEASE
William S. Wright, Newark, Ohio, assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application February 4, 1933, Serial No. 590,945
5 Claims. (Cl. 192—.01)

1. The combination in an automobile engine having an intake manifold, an accelerator controlled throttle valve connected to said manifold, and a clutch operating member, of a clutch control means comprising a flexible diaphragm open to the atmosphere on one side and closed to the atmosphere on the opposite side and connected to the clutch operating member, a pipe connecting the closed side of the diaphragm to the manifold, two valves located in the pipe and adapted to control said clutch control means, one of said valves being actuated by the accelerator to establish communication between the manifold and the closed side of the diaphragm when the accelerator is in retracted position, and to close this communication and establish open communication between the closed side of the diaphragm and the atmosphere when the accelerator is advanced, the other valve being manually operated to open communication through said pipe when in one position and to close this communication and open communication between the atmosphere and the closed side of the diaphragm when in another position, means for actuating the valve, which is operated by the accelerator in advance of the opening of the throttle valve, and for closing the throttle valve in advance of the actuation of this valve.

2,109,097
ROLLED STOCK HOLDER
Charles E. Bartram, Kansas City, Mo.
Application August 25, 1937, Serial No. 160,805
1 Claim. (Cl. 242—55.2)

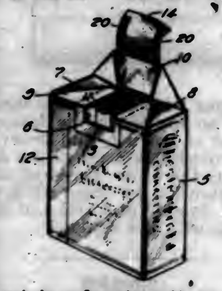
A holder of the kind described, comprising a bracket; a spindle secured at one end to the bracket and provided with a pair of longitudinally extending, parallel ears at the other end; a transverse pin in the ears extending across the space between said ears; and a retaining finger having a longitudinal slot formed therein adjacent to and spaced from one end thereof, said pin being extended through said slot, said finger being arched at one corner of said one end to



permit its being oscillated about the transverse pin through an arc when the latter is at the outermost end of the slot, said finger being of a width substantially the same as the distance between the ears the other corner of said one end serving as a stop for the finger when the same is at one end of its path of travel and in longitudinal alignment with the spindle.

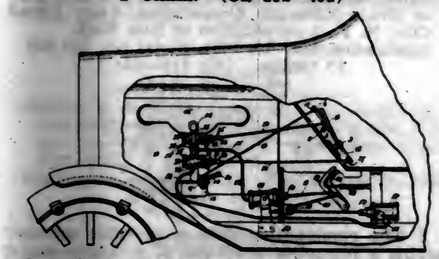
2,109,098
WHEEL ATTACHMENT
Clyde McClain Baxter, San Clemente, Calif.
Application April 20, 1937, Serial No. 138,019
7 Claims. (Cl. 55—73)

1. In a mechanism of the class described, the combination of a frame, a plurality of crank-axle units on said frame, each crank-axle unit comprising suspension brackets above said frame, a crank-axle suspended on said brackets and spaced from said frame, and said crank-axle provided with a handle adapted to be placed in different positions upon said frame.



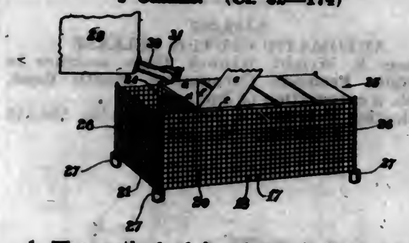
2,109,099
CLUTCH CONTROL MECHANISM
Caleb S. Bragg, Palm Beach, Fla., and Victor W. Kliesrath, Port Washington, N. Y., assignors to Bragg-Kliesrath Corporation, Long Island City, N. Y., a corporation of New York
Application May 15, 1931, Serial No. 537,650
17 Claims. (Cl. 192—91)

1. The combination with a movable member having a retractive tendency, of a double-ended fluid motor, a piston in said motor operatively connected to said movable member, said piston being normally subjected on both of its faces to atmospheric pressure, valve means for controlling said motor to evacuate the fluid from one side of said piston to establish pressure differentials in said motor and effect a movement of said piston and its connected movable member, said valve means also being operative to control said motor to distribute the fluid within the motor, to thereby destroy the existing pressure differential,



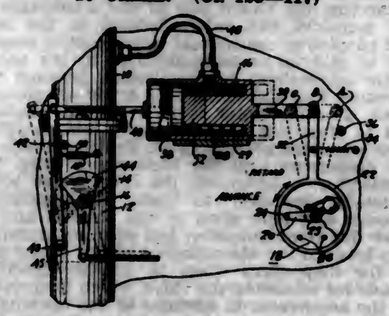
said fluid when distributed exerting a sub-atmospheric pressure, whereby a controlled and predetermined retractive movement of said movable member is effected.

2,109,100
CONTAINER
John D. Brophy, New York, N. Y.
Application September 5, 1935, Serial No. 39,232
2 Claims. (Cl. 229—37)



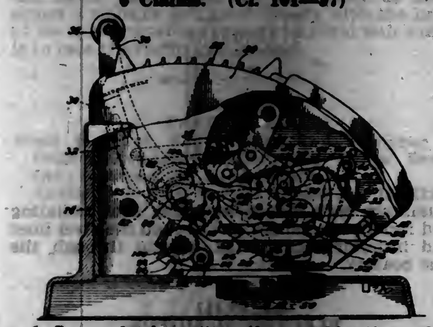
1. In a container for cigarettes and the like, a substantially rectangular casing which is permanently closed at its lower end and is provided with integrally formed closure flaps along its four upper edges, the front closure flap having a centrally disposed rectangular cut-away portion extending from its upper edge to a point below the upper edge of the front wall of the container, the rear closure flap being positioned over the front closure flap when in a closed position, a rectangular member of greater width than the width of the cut-away portion adhesively joined to the front and rear walls and to the closure flaps, retaining the latter in position, the lower front portion of said rectangular member being unsecured to said front wall and forming a tear tab.

2,109,101
CONTROL MEANS FOR AUTOMOBILES
Harold E. Clarke, Somerville, Mass., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application January 2, 1932, Serial No. 584,545
1 Claim. (Cl. 192—.01)



In a device of the character specified the combination of a throttle control pedal, means connecting said pedal with the engine throttle, a clutch control pedal means connecting said clutch control pedal with a clutch operating control means and means for yieldably retaining said pedals respectively in fully retracted positions, such that said clutch control pedal is retracted further than said throttle control pedal said pedals being closely associated and arranged in a manner whereby they may be successively and jointly operated by the foot of the operator when said foot is located in the placement and moved in the manner required to operate said throttle control pedal, said throttle control pedal being provided with an opening within which said clutch control pedal is adapted to enter.

2,109,102
METHOD OF PREPARING AND SERVING ICE CREAM
George W. Cocks, Upper Montclair, N. J., assignor to Marathon Paper Mills Company, Rothschild, Wis., a corporation of Wisconsin
Application October 1, 1936, Serial No. 103,562
9 Claims. (Cl. 62—174)



1. The method of forming a bulk package of frozen material to have a predetermined contour in a distortable container which comprises providing a receptacle constructed of distortable material so as to have a predetermined contour, confining the side walls of said receptacle so as to retain said predetermined contour, substantially filling said receptacle with a material which is expansible upon freezing, and subjecting said container to freezing conditions so as to harden said material without substantially bulging or distorting said container from its predetermined contour.

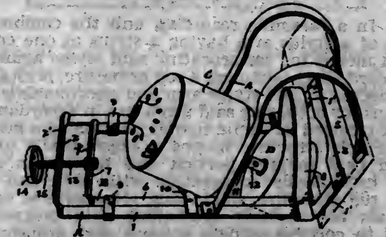
2,109,103
IGNITION TIMING CONTROL
Don Cole, Evanston, Ill., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application September 10, 1934, Serial No. 743,375
10 Claims. (Cl. 123—117)

1. An internal combustion engine having an ignition system including a distributor, a carburetor having a throttle valve, a source of suction posterior to said throttle valve, means connecting said distributor and carburetor and comprising a cylinder operably connected with said distributor, a piston slidably mounted within the cylinder, yielding means urging the cylinder toward one extreme position, connecting means between the cylinder and the source of suction, and connecting means including a throttle actuated cam between said piston and said throttle valve.

2,109,104
CHECK WRITER
Fred W. Dahlberg, Chicago, Ill., assignor to The Hedman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application February 19, 1936, Serial No. 64,625
6 Claims. (Cl. 101—97)

1. In a check writer, the combination of a platen, selectively set type movable toward and away from the platen to print and scarify amount designations upon the negotiable instrument placed between the platen and type, means for applying ink to the faces of said type comprising an inking pad, means for positively holding said pad stationary during the initial portion of the movement of said segments toward said platen, and means for releasing said holding means after said type have been pressed against said pad.

2,109,105
APPARATUS FOR PROTECTING PILES, PIERS, ETC.
Robert Morse Deull, Montreal, Quebec, Canada, assignor to Gunite and Waterproofing Limited, Montreal, Quebec, Canada
Application October 27, 1936, Serial No. 107,845
In Canada April 7, 1936
4 Claims. (Cl. 61—50)

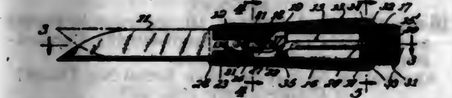


1. A protective enclosure for piles, piers, docks and similar structures comprising vertically spaced top and bottom frame members mounted on the structure to be protected, vertically extending angle irons engaged with corner portions of said frame members, said angle irons being spaced from said structure, and superposed sheeting members extending between the angle irons at each side of said structure, the sheeting members at each side of the protected structure being held against vertical displacement between the top and bottom frame members and being held against horizontal displacement by said angle irons and by interlocking engagement with the sheeting members at the adjacent sides of said structure.

2,109,106
SOCKET
Henry M. Dressel, Chicago, Ill., assignor, by mesne assignments, to Cinch Manufacturing Corporation, a corporation of Illinois
Application March 29, 1934, Serial No. 717,907
2 Claims. (Cl. 173—328)

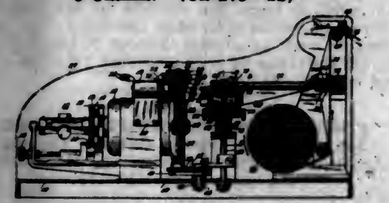
1. A socket comprising an insulating base, a plurality of contact elements supported by said base and depending therefrom, a thin insulating sheet superimposed on said base and contact members and having a plurality of apertures whereby access may be obtained to said contact members, and an elongated guide in the form of an individual piece having means for attachment to said socket, said guide located above the surface of said insulating sheet and extending along said surface from the outside to the inside of the region bounded by said apertures, said guide adapted to act as a feeler thereby to facilitate the correct entrance of a cooperating tube base into said contact elements.

2,109,107
PORTABLE MOTOR KNIFE GRINDER
John E. Eadie, Jarvis, Ontario, Canada
Application April 26, 1937, Serial No. 138,955
8 Claims. (Cl. 51—173)



3. A portable blade-grinding device comprising inter-fitting frame members slidably connected and disposed in a common plane, one of said frame members having guide extensions disposed in a plane angularly intersecting the aforesaid plane for guiding contact with the blade to be ground, a grinding wheel rotatably mounted in the other of said frames presenting a flat outer surface for diametrical bevel-grinding contact with the edge of the blade, the axis of said grinding wheel being disposed in a plane angularly intersecting the plane of disposition of said frame and the plane of disposition of said blade-engaging guide means, means for slidably adjusting said grinder-carrying frame in the other frame, and means for rotating said grinding wheel.

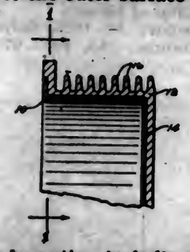
2,109,108
KNIFE
Douglas F. Fesler, Woodstock, Ill.
Application August 19, 1935, Serial No. 36,784
2 Claims. (Cl. 30—337)



2. In a detachable blade knife, the combination of a blade having a tang with a notch near its

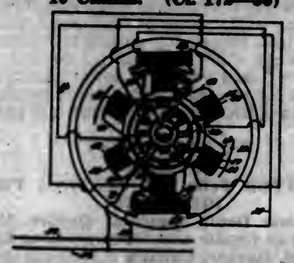
end, a handle having a socket conformed to receive the tang of said blade and hold it against rotation relative thereto, a resilient member for holding said blade against withdrawal from said handle, said member having a hook at one end engageable with the notch in said tang and having a thread formed at its other end, a manually

engageable nut swiveled to said handle and screwed on the threaded end of said resilient holding member, means in said handle to prevent rotation of said member, and a cam surface formed within said handle and operable to disengage the hook portion of said member from said notch when said member is forced into said handle by turning said nut relative thereto.



2,109,109
CONTINUOUS SHEET FACSIMILE RECORDER
William G. H. Finch, Spuyten Duyvil, N. Y.
Continuation of application Serial No. 123,770, February 3, 1937. This application March 24, 1937, Serial No. 132,690
5 Claims. (Cl. 178—11)

1. In a facsimile recording unit the combination of a stylus arm having a stylus at one end, with means for reciprocating said stylus against a record sheet including a rod armature, pivotally connected to said stylus arm and electromagnetic means for actuating said armature in accordance with received facsimile signals comprising a magnetic pole structure having a substantially uniform field magnet portion and having an air gap individually cooperating with each end of said rod armature, coil means, responsive to said signals for variably controlling said magnetic field to correspondingly actuate said armature, said rod armature being pivotally and centrally supported within said pole structure and between said air gaps; means for moving said stylus in synchronism with the transmitter scanning operations comprising a member secured to said reciprocating means, and mechanism for oscillating said member; and means for controlling the maximum excursion of said stylus comprising two opposed screw members positioned adjacent the free end of said armature, adjustably positionable with respect to said free armature end whereby said screw members abut said armature when said armature vibrates a predetermined degree.



2,109,110
BRAKE DRUM
Frederick C. Frank, South Bend, Ind., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application September 16, 1935, Serial No. 40,719
1 Claim. (Cl. 188—218)

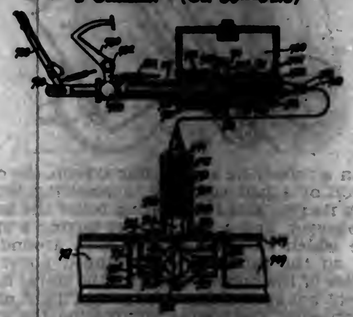
An airplane brake drum comprising a steel liner having a closed end provided with an aperture to receive a wheel supporting member and an open end, a reinforcing web flanged outwardly at the open end of the liner, a thin coating of zinc applied to the outer surface of the liner, an

aluminum body section including heat radiating and rigidifying flanges cast around the steel liner and intimately connected thereto through the zinc coating.

2,109,111
ELECTRICAL MOTOR
Roy E. Gearhart and Everett L. Renshaw, Chicago, Ill.
Application June 15, 1936, Serial No. 85,346
10 Claims. (Cl. 172—36)

1. In an electric motor, an armature, field members located about said armature, an annular compartment carried concentrically with said armature, a series of contact points extending within said compartment; and a gravity biased electric conductor member in said compartment adapted to remain in the lower portion of said annular compartment and co-operate with said contact points as the armature is rotated whereby current is successively delivered to said field members.

2,109,112
CONTROLLING DEVICE FOR WINDOW SHADE ROLLERS
Andrew C. Hansen, Racine, Wis.
Application March 10, 1937, Serial No. 129,976
9 Claims. (Cl. 156—28)



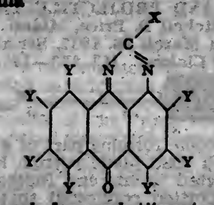
9. A curtain roller fixture comprising a casing, a sheave journaled within said casing and having means accessible through an end wall of the casing and engageable with the end of a curtain roller, said casing also having a pair of vertical walls extending at right angles to said end wall, an operating cord engageable with the sheave and having an end depending from the casing, a brake member engageable with a portion of said cord to apply tension thereto, each of said vertical walls being formed with a slot for receiving a portion of said brake, and an adjustment bolt having a traveling nut thereon engageable with said brake to vary the tension exerted thereby, each of said vertical walls having similar openings for cooperation with said adjustment bolt whereby the same casing may be assembled to form either a right or left hand fixture with the head of the bolt accessible from the vertical wall which is to face the room.

2,109,113
CARBURETOR
Scott F. Hunt, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application April 2, 1934, Serial No. 718,633
11 Claims. (Cl. 123—119)

1. In a carburetor having an air-horn, a choke shaft journalled in the walls of the air-horn, an unbalanced choke valve mounted on the choke shaft, thermostatic means operably connected with the choke shaft, a source of heat, and heat transmitting means utilizing the latent heat of vaporization of a liquid and including a closed conduit containing a supply of liquid one end of the conduit communicating with a sealed annular chamber surrounding the thermostat and the other end communicating with the source of heat.

2,109,114
HYDRAULIC BOWDEN CONTROL
Henry H. Kerr, Jr., South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application March 18, 1933, Serial No. 661,617
8 Claims. (Cl. 60—54.5)

1. A hydraulic control system having a conduit, a cylinder connected to the conduit, hydraulic control liquid therein, a flexible control cable lying in said conduit and adapted to slidably move therein, a piston in the cylinder and a slidable member longitudinally extending through said piston and connected to said cable.



2,109,115
EYESHADE
Otto A. Kleine, Chicago, Ill.
Application July 29, 1935, Serial No. 33,679
13 Claims. (Cl. 2—12)

1. An eye-shade comprising a frame adapted to be mounted in an eye-glass bow, a shade member having a plurality of face portions adjustably mounted in said frame, and resilient friction means engageable directly with a face portion of said shade member and with said frame for yieldably retaining the shade member in various adjusted positions vertically with respect to said frame and bow.

2,109,116
DERIVATIVES OF THE ANTHRAPYRIMIDINE SERIES
Max Albert Kunz, Mannheim, and Karl Koeberle, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application November 23, 1932, Serial No. 644,134. In Great Britain May 18, 1931
5 Claims. (Cl. 260—32)

1. Anthrapyrimidines corresponding to the general formula

in which X stands for a substituent selected from the group consisting of Cl, Br, I, F, —NHR, —NHR$_1$, —OR, —SR, —CN, —N=N—Cl, wherein R stands for a radicle of the benzene or anthraquinone series and R$_1$ stands for an alkyl radicle and up to three of the positions indicated by Y may be substituted by a substituent selected from the group consisting of halogen, the alkyl, aryl, alkoxy, aryloxy, amino, acylamino and nitro groups at least one position marked Y being substituted by an acylamino group.

2,109,117
ALUMINIUM ALLOY
Yonesuke Matsunaga, Naka-ku, Yokohama, Japan
No Drawing. Application May 8, 1936, Serial No. 78,721. In Japan May 12, 1935
1 Claim. (Cl. 75—142)

An aluminium alloy consisting of 2 to 5% magnesium, 6 to 14% zinc, 0.3 to 2% copper, 0.1 to 0.5% iron, 0.1 to 1.0% silicon and the remainder aluminium, the content of silicon being always greater than that of iron.

2,109,118
MANUFACTURE OF ARTICLES FROM STEEL ALLOYS
Friedrich Karl Naumann, Essen, Germany, assignor to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany
No Drawing. Application March 3, 1934, Serial No. 713,925. In Germany March 20, 1933
4 Claims. (Cl. 23—252)

1. Articles which in their normal use are sub-

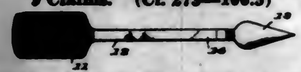
jected to the attack of hydrogen at high hydrogen partial pressure and high temperature, said articles being made of a steel alloy containing carbon in an amount not exceeding 0.4%, over 0.3% and up to 2% of one or more elements of group V of the Periodic table which form carbides in the steel, metal from the group tungsten and molybdenum in an amount not exceeding 3%, and chromium in an amount less than 5%, the remainder substantially all iron.

2,109,119

MANUFACTURE OF ARTICLES FROM STEEL ALLOYS

Friedrich Karl Naumann, Essen, Germany, assignor to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany

No Drawing. Application March 3, 1934, Serial No. 713,926. In Germany March 20, 1933
5 Claims. (Cl. 23—252)



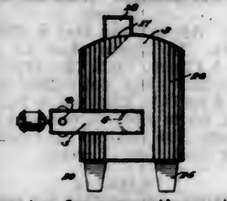
1. Articles which in their normal use are subjected to the attack of hydrogen at high hydrogen partial pressure and high temperature, said articles being composed of a steel alloy containing an effective amount not over 5% of one or more elements selected from the group zirconium and thorium, and not over 1% of carbon, the remainder substantially all iron.

2,109,120

GAME AND PROJECTILE THEREFOR

Mitchell D. Price, Miami, Fla.

Application March 26, 1937, Serial No. 133,237
9 Claims. (Cl. 273—106.5)



1. A projectile forming part of a casting game comprising a rigid plane portion having a solid head connected to one end thereof and a rigid plane tail portion connected to the other end thereof integral therewith and disposed at right angles thereto, said rigid portions and head having substantial thickness and weight.

2,109,121

METHOD AND APPARATUS FOR GRADING PARTICLES DIFFERING IN SPECIFIC GRAVITY

Frederick Walter Therold, Niagara Falls, N. Y., assignor to Chisholm-Ryder Co., Inc., Niagara Falls, N. Y.

Application December 22, 1933, Serial No. 703,627
14 Claims. (Cl. 209—156)

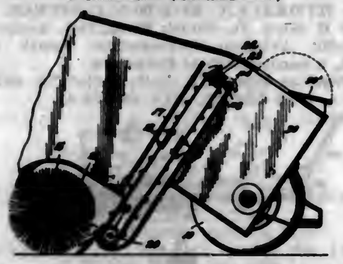
1. In apparatus for separating articles of different specific gravity from a mixture of articles, a tank adapted to contain liquid, a circular top plate for the tank, a pipe extending horizontally inward beneath the top plate, a delivery pipe extending from said pipe through the top plate, a cylinder extending upward from the periphery of the top plate, a strip secured at its lower edge to the top plate and extending in a spiral from the upwardly extending delivery pipe to form with the cylinder at the periphery of the top plate a continuous channel of uniform size, a horizontal plate in said channel at its outlet end above the parallel with the top plate dividing the channel into an upper and a lower passage, means for conducting liquid from the outlet end of the channel back to the tank, means for causing liquid to circulate from the tank through the channel and back to the tank, and means for supplying articles to be separated arranged to deliver the articles downward in line with the delivery pipe onto the column of liquid discharged from it.

2,109,122

MAKING FERROCHROMIUM

Marvin J. Udy, Niagara Falls, N. Y.

No Drawing. Application May 3, 1935, Serial No. 19,749
14 Claims. (Cl. 75—11)



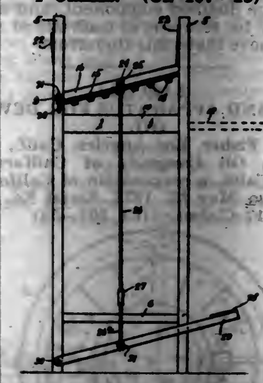
1. In making ferrochromium of high chromium content and of controlled carbon content from chromite ores containing chromium and iron in an electric furnace with the aid of carbon as reducing agent, the continuous process which comprises the continuous step of smelting the ore with an amount of carbon adjusted to reduce both the chromium and iron of the ore and to supply a predetermined content of carbon in the ferrochromium and in the presence of CaO with the ore in amount sufficient to form with the impurities present a slag having a molecular ratio of bases to acids about 2:1 and at a temperature sufficient to make such slag thinly fluid and free-running and separating the molten slag and the molten ferrochromium.

2,109,123

GUARD ROLLER FOR SWEEPING MACHINES

Benjamin B. White and Charles H. Young, Miami, Fla., assignors of one-third to E. F. P. Brigham, Miami, Fla.

Application September 12, 1936, Serial No. 100,532
5 Claims. (Cl. 214—17)



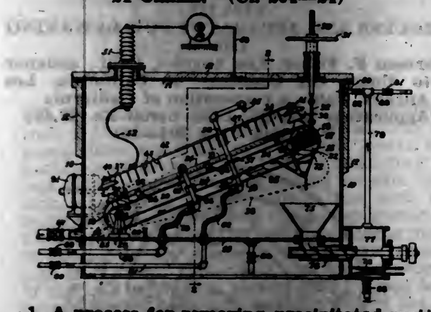
1. In a conveying and storing system, the combination of a belt conveyor, a receiving hopper having its rear side terminating below the top of the conveyor, and a guard roller having a spiral flange which extends at least once around the roller on the face thereof arranged above the rear side of the hopper and with the spiral flange adjacent but spaced from the return flight of the belt conveyor, and means for rotating the guard roller in the direction of movement of the upper flight of the conveyor so that the guard roller shall prevent refuse accumulating between the rear side of the hopper and the return flight of the belt conveyor and the spiral flange shall assist in delivering material from the conveyor to the hopper.

2,109,124

DOUGH PRESSING MACHINE

Ezel G. Young, Detroit, Mich.

Application April 22, 1937, Serial No. 138,653
4 Claims. (Cl. 107—15)



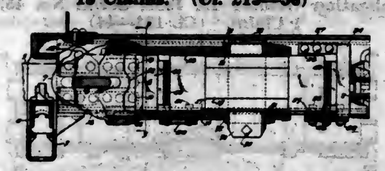
1. In a machine for pressing dough or other plastic material, a supporting bed or platform, supporting legs for said platform having upper ends extending upwardly beyond said platform, a presser member disposed within the confines of the upper ends of said supporting legs, and positioned above said bed, spring devices suspending said presser member from the upper ends of said legs, two opposed legs above said bed being provided with slots, and a pivot rod for said presser member extending transversely of the latter adjacent one edge of the bed and having free ends working in said slots.

2,109,125

PROCESS AND APPARATUS FOR DEWAXING OILS

Blair G. Aldridge, Los Angeles, and Basil Hopper, Palos Verdes Estates, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California

Application May 29, 1936, Serial No. 82,510
21 Claims. (Cl. 204—24)



1. A process for removing precipitated matter from liquids comprising flowing a film of said liquids over the surface of a depositing electrode and establishing an electric field between said depositing electrode and a second ionizing electrode substantially surrounded by a gaseous medium and which is directed toward the surface of said depositing electrode, said electric field being of sufficient intensity to produce an electrical windage impinging upon said film whereby precipitated matter in said liquid is deposited on said depositing electrode and moving said depositing electrode surface in a direction countercurrent to the flow of said liquid film.

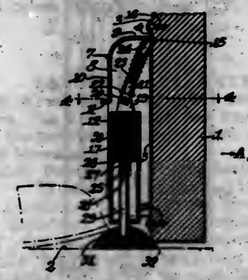
2,109,126

DRAFT RIGGING

Donald S. Barrows, Rochester, N. Y., assignor to The Symington-Gould Corporation, Rochester, N. Y., a corporation of Maryland

Application May 19, 1930, Serial No. 453,667
18 Claims. (Cl. 213—56)

4. In railway draft rigging, in combination with draft sills, a coupler, a draft gear, a rear follower for said gear, means connecting said coupler and gear for moving the latter forward independently of said rear follower, a backstop normally engaged by said rear follower for limiting rearward movement thereof, supporting means underlying said follower, and a stop member connected to said supporting means forwardly of said follower for holding it in engagement with said backstop.

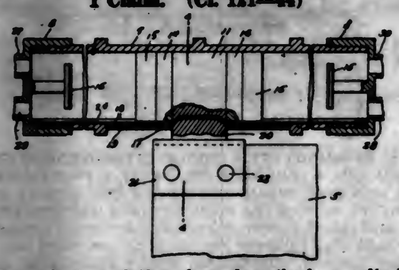


8. In railway draft rigging, in combination with draft sills, a drawbar and connected vertical yoke-acting means, a friction draft gear comprising a column member, a set of friction elements cooperating with said column member at each end, a follower engaging said friction elements at each end of the gear, front stop means for preventing forward movement of the front follower while permitting rearward movement thereof, and back stop means preventing rearward movement of the rear follower, means for maintaining said followers in upright positions, the connection between the drawbar and yoke-acting means allowing rearward buffing movement of said drawbar independently of said yoke-acting means, said yoke-acting means being connected to said column member for actuating only the front elements on draft, said drawbar engaging the front follower directly on buff for actuating the front friction elements, and moving the column member to actuate the rear friction elements.

2,109,127

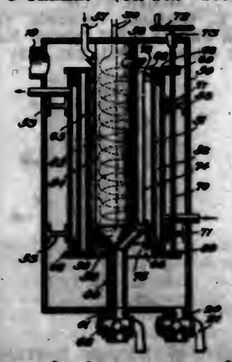
DOOR STOP

Otto E. Carlson, Vernonia, Oreg.



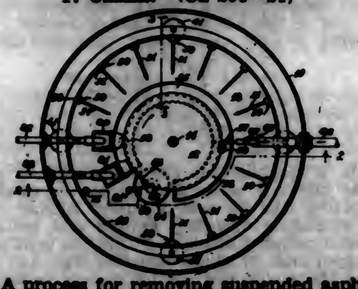
Application June 8, 1937, Serial No. 147,125
2 Claims. (Cl. 292—69)

1. In a device of the class described, a casing having a stop, a lever fulcrumed intermediate its ends on the casing, a plunger slidable on the



lever, a foot on the lower end of the plunger and shaped to be engaged beneath a door, spring means for moving the plunger outwardly with respect to the lever, and spring means assembled with the casing and with the upper end of the lever for swinging the lever and the plunger upwardly into an approximately horizontal position, in engagement with the stop.

2,109,128
CLOSURE OPERATOR
Jesus Leal Carrillo, Long Beach, Calif.
Application October 15, 1935, Serial No. 45,138
1 Claim. (Cl. 121—44)



In a device of the class described, a cylinder provided with an elongated slot therein, the sides of said slot being stepped inwardly, a piston mounted for reciprocation in said cylinder, said piston having a shank extending therefrom and operating in said slot, the sides of the shank being stepped to register with the stepped sides of the slot, means for connecting the respective ends of the cylinder with a source of air supply for reciprocating said piston, and means for sealing the slot in the cylinder without impairing the reciprocatory movement of the cylinder, said means including a flexible tape anchored at its respective opposite ends to said cylinder, said tape extending longitudinally in said slot and said shank having an opening therethrough accommodating said tape.

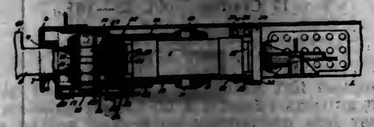
2,109,129
APPARATUS FOR HIGH VACUUM DISTILLATIONS
Eric William Fawcett and John Lewis McCowen, Northwich, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain
Application July 30, 1936, Serial No. 93,338
In Great Britain March 7, 1934
8 Claims. (Cl. 202—205)

3. Apparatus for high vacuum distillation of materials yielding upon distillation at least one non-fluent component, comprising a chamber adapted to be evacuated, means providing a hot evaporating surface in the chamber, means providing a cool condensing surface in the chamber closely spaced from the hot surface and adapted to receive the distilled component, and means in the chamber for scraping at least one of said surfaces to remove materials therefrom.

2,109,130
PROCESS AND APPARATUS FOR DEWAXING OIL
Harmon F. Fisher, Los Angeles, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Application May 25, 1935, Serial No. 23,468
17 Claims. (Cl. 204—24)

4. A process for removing suspended asphaltic bodies from oil which comprises applying a film of said oil to the surface of a depositing electrode of extended area and establishing an electric field between said depositing electrode and a second electrode of relatively small area as compared with said depositing electrode, said second electrode being substantially surrounded by a gaseous medium and spaced from said film of oil and directed toward the surface of said depositing electrode and said electric field being of sufficient intensity to deposit the suspended asphaltic bodies in said film of oil on said depositing electrode and depositing said asphaltic bodies in a layer on said depositing electrode surface under the influence of said electric field.

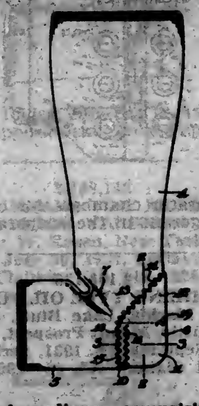
2,109,131
PROCESS AND APPARATUS FOR DEWAXING OIL
Harmon F. Fisher, Los Angeles, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Application May 25, 1935, Serial No. 23,469
10 Claims. (Cl. 204—24)



1. A process for removing precipitated matter from oil, comprising applying the mixture in a layer to a depositing electrode surface, maintaining an ionizing electric field between a pair of electrodes adjacent to said depositing electrode surface sufficient to ionize the intervening gases, impressing another electric potential between one of said pair of ionizing electrodes and said depositing electrode sufficient to move the said ionized gas in the form of an electrical windage impinging upon said oil layer on said depositing electrode surface whereby precipitated matter in said oil is deposited on said depositing electrode.

2,109,132
CIGARETTE
Walter C. Bigley, Toledo, Ohio
Application February 21, 1936, Serial No. 65,119
5 Claims. (Cl. 131—52)

1. A cigarette comprising a wrapper, one end portion of said wrapper including inwardly tucked opposite side portions forming a substantially tapered tip, and an ignitable head on the free end portion of said tip.



2,109,133
DRAFT RIGGING
Byers W. Kadel, Baltimore, Md., assignor to The Symington-Gould Corporation, Rochester, N. Y., a corporation of Maryland
Application March 2, 1931, Serial No. 519,240
16 Claims. (Cl. 213—22)

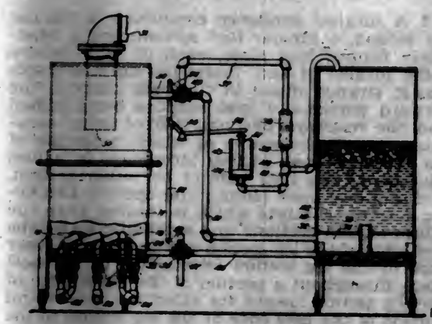
3. In railway draft rigging, in combination with a drawbar, and vertically spaced links disposed above and below said drawbar, means connecting said drawbar and links, a cushioning device comprising a housing resting on said lower link, cushioning means cooperating with said housing at each end, stop means for preventing forward movement of the front cushioning means while permitting rearward movement thereof, and stop means preventing rearward movement of the rear cushioning means, said housing being provided with trunnions extending from the upper and lower surfaces thereof, the rear ends of said links being pivotally mounted on said trunnions for actuating only the front cushioning means on draft, the means connecting said links and drawbar being constructed movable with respect to said links whereby said drawbar actuates both front and rear cushioning means on buff.

16. In railway draft rigging, in combination with draft sills, a backstop connecting said sills, and an integral draft gear carrier secured to said sills and disposed forwardly of, and below, said backstop and having a rear portion offset downwardly to provide a shoulder parallel to and forward of the front face of the backstop for holding an associated rear follower in position in front of said backstop.

2,109,134
SURGICAL APPLIANCE
Arthur R. Kendrick, East Orange, N. J., assignor to James R. Kendrick Co., Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application October 30, 1936, Serial No. 108,437
2 Claims. (Cl. 2—239)

2. A surgical appliance comprising a tubular leg section, a tubular foot section, and a separately formed heel piece, each of said sections being formed of knit fabric having stretchable elastic strands inlaid in the body thereof, the forward portions of said sections being united and the rearward portions thereof being separated by a heel opening at which a portion of the fabric of each section terminates in a heel edge facing the heel edge of the other section, and said heel piece closing said opening and being formed of fabric which is thinner than the fabric of said sections and extending above the heel edge of the leg section and having the lower edge of the leg section unattached to the heel piece throughout a portion of the lower edge of the leg section, means for attaching the central portion of the heel edge of the leg section to the heel piece, means for attaching the upper edge portion of the heel piece to the leg section in spaced relation to the heel edge thereof, and means for attaching the lower edge portion of the heel piece to the foot section.

2,109,135
CHILLING APPARATUS
Verney E. Kreft, Pittsburgh, Pa., and Arthur Bee, Newark, N. J., assignors to Carbondale Machine Corporation, Harrison, N. J., a corporation of New Jersey
Application February 5, 1937, Serial No. 124,190
14 Claims. (Cl. 62—114)



1. In a chilling apparatus, a conduit for conducting liquid to be treated comprising a plurality of vertically spaced pipe sections arranged in serially connected superposed tiers, evaporator jackets individual to said horizontal pipe sections and forming evaporator chambers about the pipe sections, a distributor for delivering

liquid refrigerant to said refrigerant chambers, and means in said distributor individual to each

tier of evaporator chambers for controlling the level of refrigerant in the evaporator chambers.

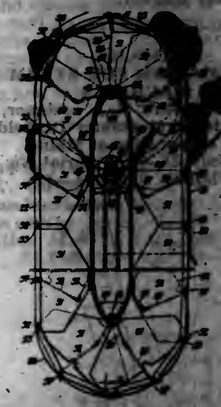
2,109,136
ATOMIZING TYPE OIL FOGGER
Matthew G. Markle, Lake Bluff, and Loren W. Tuttle, Mount Prospect, Ill.
Application September 8, 1931, Serial No. 561,629
1 Claim. (Cl. 48—190)

A method of fogging a flow of gas as it passes from a transmission conduit to a distribution conduit, which comprises reducing the pressure of so much gas as is required to supply the demand upon the distribution system, dividing the flow into two streams, a main stream and a fogging stream, reducing the pressure of the main stream substantially without doing external work, reducing the pressure of the fogging stream and simultaneously bringing said fogging stream at high velocity into atomizing contact with a stream of fogging oil to load said latter gas stream with oil fog, providing for relatively free expansion of said high velocity flow during atomization to prevent impingement and agglomeration of said fog particles, and maintaining the level of the fogging oil substantially constant whereby said high velocity flow lifts the oil a relatively small but constant distance so that minimum energy of flow is employed in lifting the oil.

2,109,137
FILLER CAP FASTENER
Harold A. Marsh, Brooklyn, N. Y.
Application August 4, 1936, Serial No. 94,131
1 Claim. (Cl. 292—301)

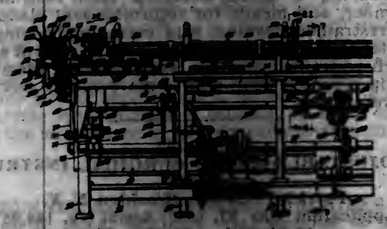
A fastener construction for a filler pipe closure including a housing having a bore fitting on said filler pipe, separate magnet and latch compartments, a top provided with an aperture registering with said bore, a hinged cap closing said aperture, said cap being hinged to open inwardly and having a flange seating on the under surface of said top, and spring means normally holding said cap in closed position, said fastener construction comprising a pivoted latch in said latch compartment normally underlying the free edge of said cap to hold the same in closed position, an armature of magnetic material carried on said latch, an electromagnet in said magnet compartment cooperating with said armature to release said latch and a wall of nonmagnetic material separating said magnet compartment from said latch compartment to isolate said magnet compartment whereby any vapors within said pipe are prevented from coming in contact with any part of the electrical circuit, said electromagnet, when energized, acting through said wall to attract said armature so as to release said latch and permit said cap to open inwardly.

2,109,138
TOOTH PINS FOR ARTIFICIAL TEETH
Frederick Manten, East Orange, N. J., assignor to Baker & Company, Inc., a corporation of New Jersey
Application September 23, 1935, Serial No. 42,639
In Canada October 5, 1934
17 Claims. (Cl. 32—10)



1. Dental accessories formed of a base metal covered with a plurality of layers of different corrosion resistant precious metals one of which is of a nature to permit diffusion thereinto of another under soldering temperatures, and an intermediate thin coating of a diffusion preventing corrosion resistant metal between said layers, whereby diffusion of the second-mentioned layer into the first-mentioned layer is prevented.

2,109,139
LOWERING APPARATUS
Frank Pardee, Jr., Hazleton, Pa., assignor to Anthracite Separator Company, Hazleton, Pa., a corporation of Pennsylvania
Application June 23, 1937, Serial No. 149,797
11 Claims. (Cl. 198—146)



1. An apparatus of the character described comprising a pair of flexible members each carrying a series of cheek plates, each cheek plate being secured to its respective flexible member

with freedom for motion relatively thereto, and reversible load carrying elements each supported

at one end by said cheek plates and at its other end by said flexible members.

2,109,140
AUTOMATIC SPINDLE RESETTING MECHANISM
Max Richter, West Reading, and Julius Barcus, Wyomissing, Pa., assignors to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania
Application May 22, 1935, Serial No. 23,834
29 Claims. (Cl. 66—89)

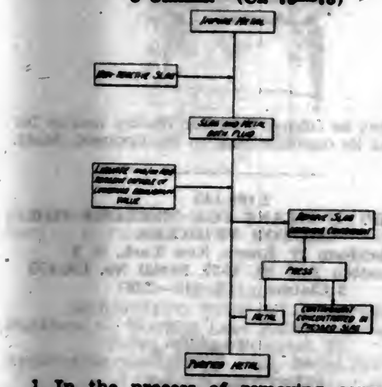
7. In the method of producing full fashioned knit stocking blanks on a straight knitting machine having narrowing mechanism and resetting means therefor, the step which comprises initiating the knitting of the welt portion of the stocking during the resetting of the narrowing mechanism.

2,109,141
GARMENT HANGER AND FOLDER
Gus Richter, New York, N. Y.
Application April 6, 1937, Serial No. 135,224
3 Claims. (Cl. 212—135)

2. A garment folder and hanger device comprising in combination with a container having two opposed walls, a pair of side rails spaced apart a less distance than the inside dimension of the container between said two opposed walls of the container, a plurality of fixed cross-bars extending transversely of said rails for retaining the rails in spaced relation, opposed cleats on said opposed walls, means for pivotally mounting the side rails at one end of each upon said cleats, the opposite ends of said rails having resilient portions normally spreading to resiliently engage said walls for retaining the device within the container, and a cross bar about which garments may be folded, said bar having means for attaching its opposite ends to the opposed cleats.

2,109,142
CLAMPING MEANS FOR MIRRORS FOR MOTOR VEHICLES
Abraham W. Rosen, New York, N. Y.
Application July 30, 1937, Serial No. 156,473
3 Claims. (Cl. 248—226)

1. A clamp adapted to be fastened to the door flange of a motor vehicle consisting of an elongated base, having its center rigidly connected to a mirror carrying rod and having one of its long sides extended to form a U to slip over the said flange, an elongated plate loosely fitted within the base having a central guide pin slidingly engaging a bore within the said rod and having a resilient cushion, and a set screw at each side of the said rod and through the elongated ends of the said base adapted to force the said plate and cushion uniformly against the said flange.



2,109,143
DRY DISINFECTANT FOR SEEDS
Fritz Wolff, Berlin, Germany, assignor to Schering-Kahlbaum A. G., Berlin, Germany, a corporation of Germany
No Drawing. Application March 20, 1934, Serial No. 716,503. In Germany March 22, 1933
3 Claims. (Cl. 167—33)

1. A non-dusting, dry disinfectant for seeds of good adhering qualities comprising fatty water-insoluble substances having an absorptive capacity for water taken from the class consisting of lecithin, isocholesterin, wool fat and its components, and fungicidal compounds, said disinfectant being substantially free from water-repellant fatty and waxy substances.

7. A non-dusting, dry disinfectant for seeds of good adhering qualities comprising fatty water-insoluble substances having an absorptive capacity for water taken from the class consisting of lecithin, isocholesterin, wool fat and its components, and fungicidal compounds, said

compounds being taken from the class consisting of mercury and copper compounds, said disinfectant being substantially free from water-repellant fatty and waxy substances.

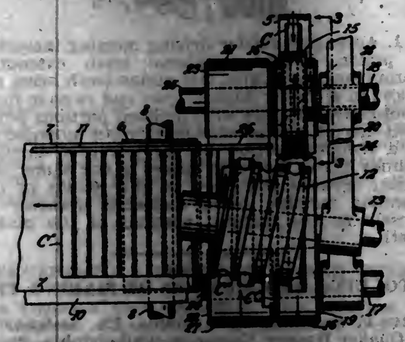
2,109,144
PROCESS OF TREATING METAL
Jesse O. Betterton and Yurii E. Lebedeff, Metuchen, N. J., assignors to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey
Application August 17, 1932, Serial No. 685,586
Renewed August 22, 1937
5 Claims. (Cl. 75—78)

1. In the process of removing copper from lead by incorporating a decopperizing reagent in the molten lead whereby copper is concentrated as a dross, the improvement which comprises conducting the operation in the presence of a fluid slag comprising a mixture of zinc chloride and sodium chloride thereby concentrating the copper in a combined slag and dross of small weight.

2,109,145
DIAPHRAGM SWITCH
Paul M. Farmer, Maplewood, N. J., and Francis C. Evans, Great Kills, Staten Island, N. Y., assignors to American District Telegraph Company, Jersey City, N. J., a corporation of New Jersey
Application June 28, 1935, Serial No. 28,858
8 Claims. (Cl. 200—83)

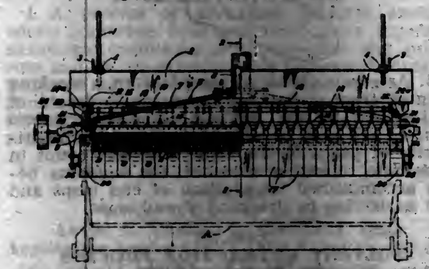
1. The combination of a metallic air operated apparatus comprising a pair of diaphragms having outer boundary margins, a washer disposed between said margins to provide a space between the diaphragms, one of said diaphragms having therein an opening, and there being a tubular coupling communicating with said space through the opening, said coupling including a pair of members which embrace the associated diaphragm around the margin of the opening; clamping means including another washer, and means integral with one of said margins and extending therefrom, said second means having a flange extending inwardly over the second mentioned washer, and an inner stiffening edge portion on said flange, said portion being engaged against the associated washer at the inner circumferential face thereof.

2,109,146
CUT-OFF MECHANISM FOR STRAW MAKING MACHINES
Karl E. Garling, Newark, N. J., assignor, by mesne assignments, to Horst-Forster-Dixfield Co., New York, N. Y., a corporation of Maine
Application July 21, 1932, Serial No. 623,761
9 Claims. (Cl. 164—42)



1. A mechanism as characterized having a cutting member for severing a moving straw, said member comprising an elongated flat thin metal blade adapted to yield to the pressure of the straw in the direction of movement of said straw when passing through said straw, and means for moving said blade through said straw, said means embodying a spring-actuated latch-restrained member, and means for returning said blade to its restrained position, said means embodying a flattened member protruding into the path of said latch-restrained member, said flattened member being mounted upon and to move with a power-driven wheel.

2,109,147
ADJUSTABLE ANGLE SURGICAL INSTRUMENT
Patrick F. Greene, Brooklyn, N. Y.
Application May 27, 1937, Serial No. 144,967
12 Claims. (Cl. 128—321)



1. In a device of the character described and in combination, a pair of handle members, a pivotal connection therebetween, the ends of said handle members extending beyond said pivotal connection to form a pair of lever arms; a pair of jaw members, a pivotal connection therebetween, the ends of said jaw members extending beyond said pivotal connection to form a pair of short arms; and means for controlling the opening and closing movement of said jaw members from said handle members and for permitting relative angular movement between said handle members and the plane of said jaw members comprising pivotal connections between said lever arms and said short arms.

2,109,148
ROTARY CIGARETTE CATCHER
George W. Gwinn, Hewlett, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey
Application June 23, 1936, Serial No. 27,923
21 Claims. (Cl. 198—25)

1. In a cigarette catcher, the combination with mechanism for receiving and guiding a line of cigarettes severed from a cigarette rod in a cigarette machine cutoff, of a single rotary means having its axis of rotation transverse to the cigarette rod for moving the severed cigarettes transversely from the path of the cigarette rod, said means having opposed spiral faces straddling the cigarette while moving it laterally so as to control the momentum of its transverse movement.

2,109,149
BURNER FOR SINTERING MACHINES
Ralph B. Horn, Brighton, Ala., assignor to The Republic Steel Corporation, Cleveland, Ohio, a corporation of New Jersey
Application May 14, 1937, Serial No. 142,634
9 Claims. (Cl. 266—21)

1. A burner for a sintering machine of the continuous type comprising a retort having a combustion chamber and a plurality of flame outlets extending thru the bottom thereof, and a mantle for said outlets comprising a plurality of individually supported bricks.

2,109,150
METHOD AND APPARATUS FOR HANDLING RUBBER ARTICLES
Edward S. Killian, Akron, Ohio, assignor to Frank B. Killian, as trustee
Application January 19, 1937, Serial No. 121,303
10 Claims. (Cl. 223—1)

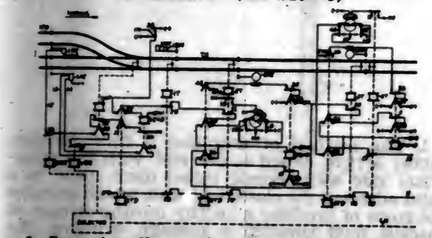
1. The method of unrolling a thin, tubular, rubber article, closed at one end, with the cylindrical side wall thereof rolled upon itself to a point adjacent the closed end wall, which includes the steps of creating a swiftly moving stream of gaseous fluid through a passage, bringing the rolled article into said stream in such a manner that the stream will move the article along the passage, and unrolling the article by subjecting it to the action of said stream and to frictional contact with the walls of the passage as it moves along the passage.

2,109,151
PROCESS FOR ARTIFICIALLY AGING ALCOHOLIC LIQUIDS AND PERFUMES
Georg Alexander Krause, Munich, Germany, assignor, by mesne assignments, to Katadyn Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application August 16, 1933, Serial No. 685,502. In Germany August 16, 1932
In Germany August 16, 1933
5 Claims. (Cl. 204—26)

1. A process for artificially rapidly aging highly alcoholic liquids which consists in solely adding to the liquid to be aged predetermined amounts of a colloidal solution of an oligodynamically active metal.

2,109,152
SECURING PLATE ON PRINTING PRESS CYLINDERS
Charles A. Meisel, Milton, Mass., assignor to Meisel Press Manufacturing Company, Boston, Mass., a corporation of Massachusetts
Application March 26, 1937, Serial No. 133,147
7 Claims. (Cl. 101—415.1)

1. In a printing press cylinder, means for clamping and tensioning interdigitated plate ends comprising a plurality of members of substantially uniform cross section set within the cylinder and defining between them longitudinally extending cylindrical bores and intersecting slots open-



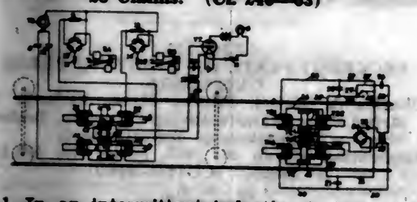
ing substantially tangentially from the bores to the surface of the cylinder, shafts rotatably received in said bores having cut-away portions and provided in the cut-away areas with projections to engage the plate ends, and means for turning the shafts alternatively to present said projections at the inner ends of the slots for engagement with plate ends entered therethrough or to retract them within the bores.

2,109,153

TRAFFIC DIRECTION CONTROLLING SYSTEM FOR RAILROADS

Robert M. Phinney, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application December 28, 1933, Serial No. 704,287
22 Claims. (Cl. 246—3)



1. In a signaling system for railroads, the combination with a single track section connecting two adjacent track sections, of a first signal for governing traffic in one direction and a second signal for governing traffic in the other direction through said section, a single control relay included in a circuit controlled by the next signal in advance of either said first or said second signal for controlling said first and second signals, manually controlled means for selecting the direction from which said relay is controlled, and a track relay controlled over one of said sections for preventing the control of said control relay by said next signal in advance.

2,109,154

INTERMITTENT INDUCTIVE TRAIN CONTROL SYSTEM

Wade H. Reichard, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application March 23, 1936, Serial No. 70,259
28 Claims. (Cl. 246—63)

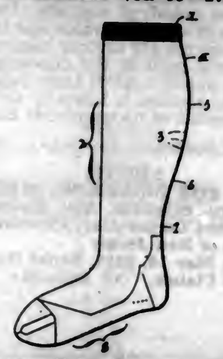
1. In an intermittent inductive train control system, vehicle equipment comprising, a control coil in a normally resonant circuit normally energized with alternating current, normally energized relay means responsive to a decrease in the normal current in said circuit, a normally de-energized clear indication receiving coil having the minimum of magnetic coupling with said coil in said circuit; and trackway means effective in one controlling condition to influence said control coil on the vehicle inductively to cause effective de-energization of said relay means, and in another clear controlling condition to receive energy inductively from said resonant circuit and induce a momentary voltage pulse in said clear indication coil and without de-energization of said relay means.

2,109,155

ENGINE STARTER DRIVE MEMBER

Younsten Sekella, Elmira, N. Y., assignor to Eclipse Machine Company, Elmira, N. Y., a corporation of New York

Application November 24, 1936, Serial No. 112,548
8 Claims. (Cl. 74—7)



1. An engine starter driving member including a pinion having peripheral teeth extending throughout its length, said pinion teeth being reduced in diameter adjacent one end so as to form abutment shoulders with inclined portions adjacent thereto, and an annular member mounted on said reduced portion having inwardly directed splines fitting the tooth spaces of the pinion, the metal between the bases of the splines in the annular member being displaced inwardly to closely fit the inclined portions of the pinion teeth.

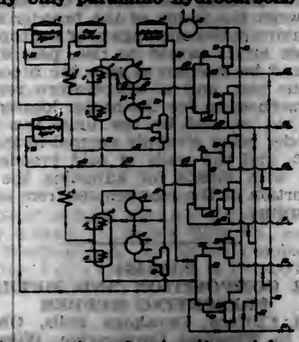
2,109,156

STOCKING AND METHOD OF MAKING THE SAME

Otto F. Smetana, Philadelphia, Pa., assignor to Quaker Hosiery Company, Philadelphia, Pa., a corporation of Pennsylvania

Application March 21, 1936, Serial No. 70,027
8 Claims. (Cl. 66—178)

1. As a new article of manufacture, a stocking formed from a flat fashioned blank devoid of fashioning marks, whereof successive fabric courses are knit by alternative use of a multiplicity of yarns of the same kind and count in a definite repeating sequence, the widening being accomplished by addition of end loops and the narrowing by dropping of end loops.



2,109,157

SOLVENT EXTRACTION PROCESS

Sijbren Tijmstra, Berkeley, Calif., assignor to Shell Development Company, San Francisco, Calif., a corporation of Delaware

Application February 4, 1936, Serial No. 62,296
5 Claims. (Cl. 196—13)

1. A process for separating a hydrocarbon fraction into paraffinic and naphthenic portions, comprising the steps of distilling the hydrocarbon fraction in the presence of a separating agent of the type of selective solvent for naphthenic hydrocarbons, to produce a distillate containing substantially only paraffinic hydrocarbons and the

separating agent, and extracting at least a portion of the remainder of the hydrocarbon mixture with a selective solvent for naphthenic hydrocarbons under conditions causing the formation of two liquid phases containing paraffinic and naphthenic portions, respectively.

2,109,158

MERCAPTAZOLE DERIVATIVES AND THEIR PROCESS OF PREPARATION

Jan Teppema, Cuyahoga Falls, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Original application July 7, 1934, Serial No. 734,232. Divided and this application July 7, 1934, Serial No. 734,230
23 Claims. (Cl. 260—44)

3. The reaction product obtainable by reacting, with the elimination of water, a 1-mercaptazole in which the mercapto group is —SH, formaldehyde, and an ammonium sulphide.

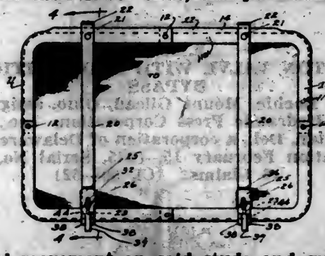
2,109,159

PROCESS FOR PREPARING FURFURYLAMINES

Charles F. Winans, Akron, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 15, 1935, Serial No. 21,667
17 Claims. (Cl. 260—54)

1. A process of preparing furfuryl amines which comprises hydrogenating under superatmospheric conditions of temperature and pressure and in the presence of a base metal hydrogenation catalyst, furfural and a solution of ammonia in an inert organic solvent which dissolves furfural and ammonia, the ammonia being present in excess.



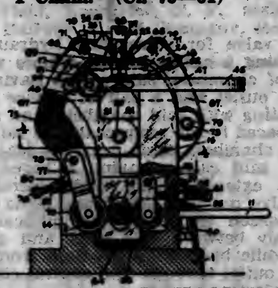
2,109,160

AUTO WINDOW SCREEN

Anton M. Yurkovich, Cleveland, Ohio

Application September 21, 1936, Serial No. 101,709
2 Claims. (Cl. 156—14)

3. A screen for automotive vehicle windows comprising a sheet of screen fabric, a thin metallic U-shaped frame embracing the edges of said fabric, and extending above the upper reach of said fabric for insertion in an automotive window frame, a pair of vertically extending strips secured to said frame, the upper end of each strip extending above the upper edge of said frame and being bent outwardly and then upwardly to engage the inner surface edge of the window frame, threaded studs carried by respective strips adjacent their lower ends, clamps mounted for



vertical movement on said studs and guidingly embracing their respective strips, each clamp being provided with means to engage opposite faces of the lower edge of the window frame to prevent relative movement between the screen and the frame, and manually operable means to secure said clamps to their respective strips.

2,109,161

SAW SETTING MACHINE

Carl G. Biro, Marblehead, Ohio

Application May 21, 1937, Serial No. 144,026
1 Claim. (Cl. 76—61)

In a saw setting machine, a frame having a fixed part for engaging a lateral surface of the saw, a clamping member pivotally supported on the fixed part for engaging the other lateral surface of the saw and clamping the saw against the fixed part, a pair of rollers, a pair of depending arms pivotally connected to the clamping member for rotatably supporting the rollers, means for intermittently moving consecutive pairs of teeth relative to the clamping member and the fixed part, a U-bar slidably supported on the frame of the machine and enclosing the fixed part and the clamping member and slidably movable along the end surfaces of the fixed part and the clamping member and having sloping surface parts for engaging the back of the saw, means for adjustably securing the sliding bar in position for adjustably positioning the saw relative to the fixed part and the clamping member, a pair of saw setting levers having finger parts for engaging consecutive pairs of teeth operative to bend the teeth laterally along the line of their bases in opposite directions, a pair of anvils for engaging and cooperating with the end parts of the fingers to shape the teeth, the opposing surfaces of the anvils and the fingers having like inclined surfaces, a pair of rollers, a pair of pivoted arms for supporting the last-named rollers

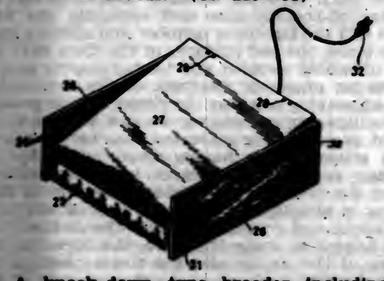
on the said levers, a cam member for operating the said rollers, and adjustable stops located on the clamping member and the levers for engaging the said arms to produce timed relation between the clamping of the saw and the operation of the said fingers.

2,109,162

PISTON VALVE WITH MID-POSITION BYPASS

Friedel Boehle, Mount Gilead, Ohio, assignor to The Hydraulic Press Corporation, Inc., Wilmington, Del., a corporation of Delaware

Application February 15, 1935, Serial No. 6,650
10 Claims. (Cl. 60—52)



1. A valve for controlling hydraulic circuits comprising a casing having a bore with a plurality of chambers, said casing having an inlet and an outlet and a pair of service ports communicating with said chambers, and a valve rod with spaced heads reciprocable in said bore, one of said chambers being centrally located in said casing, said casing having a bored projecting portion extending into said central chamber, said valve rod and said heads being adapted in one position to cut off communication simultaneously between said inlet and said service ports while by-passing the fluid from said inlet to said outlet through said central chamber past said projecting portion.

2,109,163

ELECTRICALLY HEATED BROODER

John E. Carlson, Forestville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut

Application November 15, 1934, Serial No. 753,093
5 Claims. (Cl. 119—33)

1. A knock-down type brooder including a housing having detachable sides and roof, one of said sides being a double walled unit with a heater secured to the unit between the walls, the wall of the unit between the heater and the outside of the brooder being provided with air inlet openings near the bottom, the wall of the unit between the inside of the brooder and the heater having outlet openings near the top whereby outside air is caused to rise, pass over the heater, and be discharged into the brooder adjacent the top, and a temperature responsive control mechanism for the heater located in the brooder but carried by the unit, the roof of said brooder being pivotally secured to the top of said unit, and the walls of said brooder being provided with means for adjusting the height of the portion of the roof remote from said pivotal mounting.

2,109,164

RUBBER COMPOSITION AND METHOD OF PRESERVING RUBBER

Albert M. Clifford, Cuyahoga Falls, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 22, 1932, Serial No. 639,151
2 Claims. (Cl. 18—59)

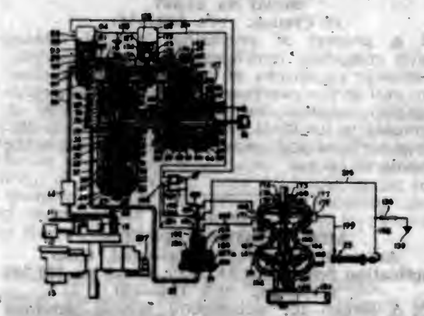
1. The method of preserving rubber which comprises treating the same with p-ethoxy phenyl naphthyl nitrosamine.

2,109,165

PROCESS OF PRESERVING RUBBER AND PRODUCT

Howard I. Cramer, Cuyahoga Falls, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 2, 1932, Serial No. 620,726
11 Claims. (Cl. 18—59)



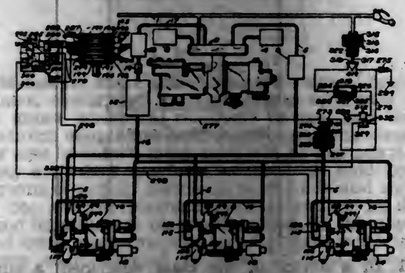
2. A rubber composition including phenyl ar tetra hydro beta naphthylamine.

2,109,166

BRAKE CONTROL FOR HIGH SPEED TRAINS

Clyde C. Farmer, Pittsburgh, and Ellis E. Hewitt, Edgewood, Pa., assignors to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application September 17, 1935, Serial No. 40,902
32 Claims. (Cl. 303—21)



1. In a fluid pressure operated vehicle brake system, in combination, a brake cylinder, a brake controlling valve device operative to cause fluid under pressure to be supplied to and released from the brake cylinder and thereby effect, respectively, the application and release of the brakes, a speed-responsive device operated in accordance with the speed of the vehicle, means controlled by the speed-responsive device for controlling the degree of the brake cylinder pressure initially attained upon the initiation of an application of the brakes, and means for rendering the pressure controlling means ineffective to cause a reduction from the initial brake cylinder pressure, as the speed of the vehicle decreases, until a substantial decrease in vehicle speed occurs.

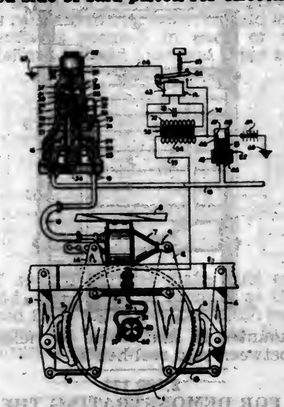
2,109,167

HIGH SPEED BRAKE EQUIPMENT

John W. Logan, Jr., Forest Hills, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application February 28, 1936, Serial No. 66,234
40 Claims. (Cl. 303—22)

1. In a brake equipment for vehicles, in combination, a brake pipe, means comprising a control valve device for supplying fluid under pressure in accordance with a reduction in brake pipe pressure, a plurality of braking means comprising a brake cylinder and means responsive to said supply of fluid under pressure comprising means for effecting one of a plurality of ratios between brake cylinder pressure and the pressure supplied by said control valve device, means for automatically selecting one of said ratios in response to vehicle speed, and means responsive to the load on the vehicle wheels associated with individual braking means for also varying the ratio between brake cylinder pressure and the pressure supplied by said control valve device.



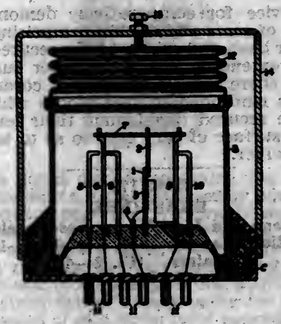
2,109,168

BRAKE CONTROL MEANS

Raymond E. Miller, Wilkinsburg, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application April 6, 1936, Serial No. 72,889
17 Claims. (Cl. 303—51)

1. In a brake equipment for vehicles, in combination, a brake cylinder, a control pipe, means for supplying fluid under pressure to said brake cylinder at control pipe pressure, a valve device for interrupting communication between said control pipe and said brake cylinder and for venting fluid under pressure from said brake cylinder to a predetermined low value, said valve device comprising a valve and a piston for moving the valve, said piston being constantly subject on one side to the pressure in the control pipe and normally subject on the other side to the pressure in the control pipe and also to an additional biasing force, electrical means responsive to the speed of rotation of a vehicle wheel for releasing fluid under pressure from the second named side of said piston for effecting movement of said valve to effect a reduction in brake cylinder pressure.



2,109,169

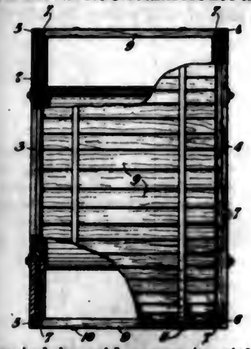
THERMAL OPERATED CIRCUIT CONTROLLING DEVICE

Oscar S. Field, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application August 15, 1934, Serial No. 739,981
7 Claims. (Cl. 200—122)

1. A thermally operated circuit controlling device comprising a bi-metallic thermal element in an enclosing bulb, means for heating said element, contacts operated by deformation of said element, and means for varying the rate of dissipation of heat from said element.

2,109,170



RETAINER FOR REEL LAGGING

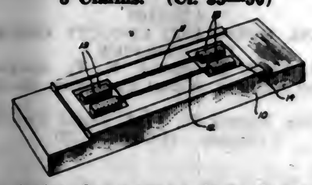
George A. Gleason, Worcester, Mass., assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey

Application June 13, 1936, Serial No. 85,162
4 Claims. (Cl. 206—59)

1. In combination, a reel including rigid heads, each of said heads being provided with a recess on

its inside surface at its circumference and resilient

means mounted in said recess to yieldably hold lagging between said reel heads.



2,109,171

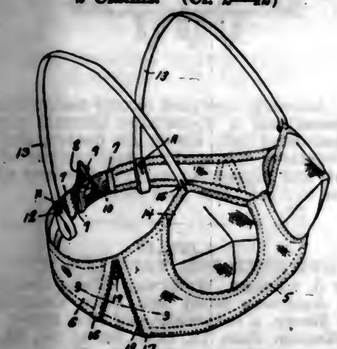
DEVICE FOR DEMONSTRATING THE ACTION OF CORDS AND THE LIKE

Philetus S. Gould, Akron, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

Application August 31, 1935, Serial No. 38,754

3 Claims. (Cl. 35—50)

3. A device for comparatively demonstrating the action of cords and the like comprising a flexible rubber base, and rubber blocks secured to said base and extending above the outer surface of said base, there being a plurality of cords having their ends embedded in said blocks while their bodies are secured throughout their lengths to the outer surface of said base so as to be visible to an observer.



2,109,172

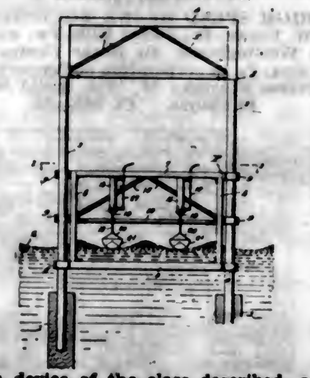
BRASSIÈRE

Lucille Green and Jean Marks, Los Angeles, Calif.

Application May 26, 1937, Serial No. 144,930

2 Claims. (Cl. 2—42)

1. A brassière consisting of a front section and rearwardly extending side sections, attaching means between the ends of the side sections, and contractible means on the said side sections adapted to contract the lower edge of the garment only in a manner to position the side sections at a lower horizontal plane relative to the front section, and removable shoulder straps for the said front and side sections.



2,109,173

WAVE MOTOR

William T. Herndon, Fayetteville, N. C., assignor of one-third to E. M. Blackwood and one-third to Thomas McInnis, both of Fayetteville, N. C.

Application February 16, 1937, Serial No. 126,078

3 Claims. (Cl. 230—67)

1. In a device of the class described, a support, a frame mounted directly on the support for vertical sliding movement and including a pontoon mounted on the support for vertical sliding movement, a cylinder fixed to the frame, a piston slidable in the cylinder, a piston rod connected to the piston, a float secured to the piston and responsive to the waves of a body of water, air inlet means for the cylinder, and an air outlet for the cylinder, through which the air passes under pressure, responsive to the movement of the piston.

2,109,174

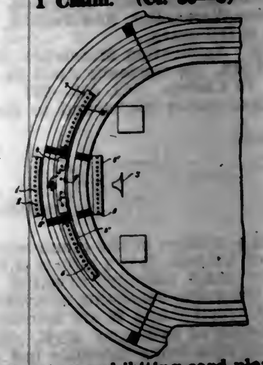
VARIABLE SPEED TRANSMISSION

Stephen Kalko, Bordentown Township, Burlington County, N. J.

Application December 30, 1936, Serial No. 118,351

9 Claims. (Cl. 74—119)

1. A variable speed transmission comprising a drive shaft and a driven shaft, a connecting rod adapted to be reciprocated by the drive shaft, a pitman adapted to impart rotation to the driven shaft, and a rocker arm intermediate the connecting rod and link, said rocker arm having a cam plate pivotally supported thereon, pivots adjustable along said rocker arm for connecting said connecting rod and pitman to the rocker arm, said cam plate being swingable to simultaneously vary the positions of the pivots lengthwise of the rocker arm, and means for imparting swinging movement to said cam plate.



2,109,175

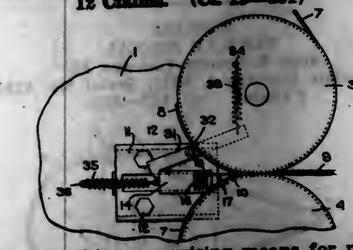
MEANS FOR STAGE EXHIBITING CARD PLAYS OF BRIDGE GAMES

John Reed Kilpatrick, New York, N. Y.

Application March 9, 1936, Serial No. 67,848

1 Claim. (Cl. 35—8)

Means for stage exhibiting card plays of bridge games, comprising a stage setting composed of an upper horizontal relatively narrow and long platform adapted to hold thirteen persons standing side by side, a lower platform of like adaptation, a central platform adapted to hold four persons standing, platforms to the left and right of the central platform and extending in the same longitudinal direction as that of the upper and lower platforms, said left and right platforms being each adapted to hold thirteen persons standing side by side, and runways connecting the central platform with each of the remaining platforms.



2,109,176

FIBER CUTTING MECHANISM FOR TAPE CONDENSER OR SIMILAR MACHINES

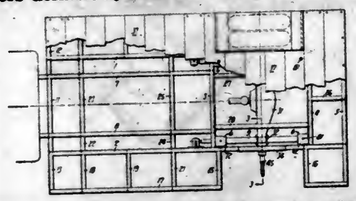
Henry H. Knight, Canton, Mass., assignor to Davis & Furber Machine Company, North Andover, Mass., a corporation of Massachusetts

Application October 26, 1937, Serial No. 171,076

12 Claims. (Cl. 19—151)

1. A machine comprising means for progressively dividing a web of fiber into slivers and diverting contiguous slivers into diverging paths, and cutting means located and operating at the rear of the line of divergence of the slivers acting to cut any fibers extended between adjacent diverging slivers.

2,109,177



TRUCK

William W. MacDonald, Mountain View, Calif., assignor to Max L. Rosenfeld, San Francisco, Calif.

Application November 2, 1936, Serial No. 47,931

4 Claims. (Cl. 280—106.5)

1. A vehicle frame comprising: a pair of spaced parallel load rails forming a part of a loading platform; a pair of spaced parallel forward and rear cross rails extending between said load rails; spring receivers secured in each of the four corners defined by said load and cross rails; and

a pair of spaced parallel main rails extending within said load rails and secured at their rear ends to said front cross rail, the main rails being spaced from the load rails so as to lie just inside the spring receivers.

2,109,178

DISPENSING APPARATUS

William L. Marden, Jackson Heights, N. Y., assignor to Neptune Meter Company, a corporation of New Jersey

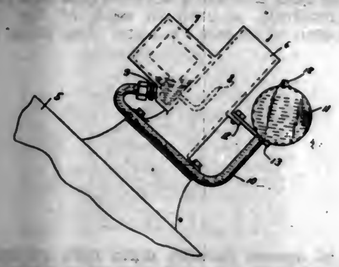
Application November 29, 1935, Serial No. 51,986

2 Claims. (Cl. 73—232)

1. In a liquid dispensing device, the combination comprising a meter actuated by flow of liquid in a dispensing operation, a hydraulic motor, common means for supplying liquid to said meter and motor to actuate the same, a worm driven by said meter in response to operation thereof, a pinion driven by said motor and meshing with said worm and a register driven by said motor for indicating the operation of said meter, said motor tending to drive said register at a rate exceeding the rate of operation of said meter at all rates of operation of said meter, said worm and pinion being arranged to prevent drive of the meter from said motor.

2,109,179

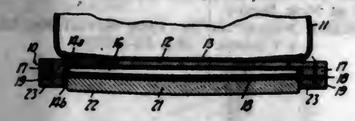
ANTIFLOODING ATTACHMENT FOR CARBURETORS



Ferris Earl Michael, Rossel, Kans.

Application April 20, 1937, Serial No. 138,034

2 Claims. (Cl. 137—31)



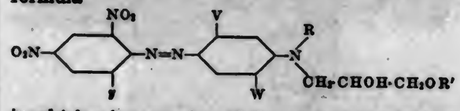
1. An anti-flooding attachment for carburetors comprising a normally empty fuel reservoir supported rearwardly of the float chamber of the carburetor and normally above the horizontal plane of the level of fuel in the float chamber said reservoir having a capacity substantially equal to that of the float chamber and a drain

pipe connecting said float chamber with the reservoir for draining fuel from the float chamber

into the reservoir when the float chamber is tilted above the plane of the reservoir.

2,109,180
SHOE CONSTRUCTION
Meade Mahan, San Mateo, Calif.
Application March 30, 1936, Serial No. 71,717
5 Claims. (Cl. 36—29)

1. In a shoe construction, sole members secured to uppers, said sole members affording a cavity in substantially the entire shoe bottom and below the insole, said cavity having a contour similar to that of the sole members but having its sides spaced from the side edges of the sole members, a bladder of resilient vulcanized rubber disposed within said cavity, a retaining sheet of flexible material extending over the lower face of the bladder and having its marginal edge portions secured to said first named sole members, and a tread sole of substantial thickness disposed within said cavity and having its upper face secured to the bottom face of said sheet of flexible material, the lower face of said tread sole normally projecting below the lower marginal faces of said first named sole members.

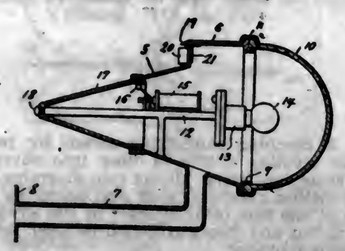


2,109,181
AUTOMATIC CUT-OFF FOR ELECTRIC IRONS
John Muldowney, St. Clair, Pa.
Application November 9, 1936, Serial No. 109,965
2 Claims. (Cl. 200—141)

1. In a mercury switch, a pair of integral parallel sealed tubes one of which is larger than the other and constituting a main tube and a condensing tube together with an integral partition wall common to the tubes and provided at one end with an opening therethrough connecting said tubes, a body of mercury in said main tube and electrodes extending through the respective opposite end walls of the main tube and extending into said body of mercury.

2,109,182
MONOAZO COMPOUNDS AND THEIR PRODUCTION
Heinrich Ohlendorf and Erich Baumann, Dessau in Anhalt, and Karl Heinsch, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application March 31, 1934, Serial No. 718,512. In Germany April 15, 1933
10 Claims. (Cl. 260—96)

6. The dyes which correspond to the general formula

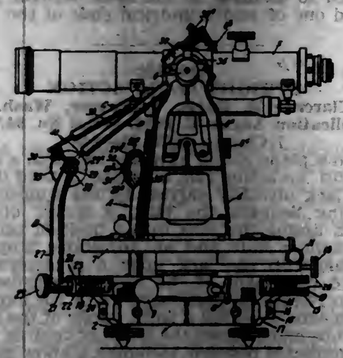


in which y is a member of the group consisting of hydrogen and halogen, R is a radicle of the group consisting of alkyl and hydroxyethyl, R' is a member of the group consisting of hydrogen and alkyl and in which V and W are members of the group consisting of hydrogen, alkyl, alkoxy and halogen, said dyes being insoluble but emulsifiable in water, and dyeing acetate silk clear fast tints from yellow to blue.

2,109,183
PROCESS FOR THE MANUFACTURE OF AZO DYESTUFFS
Hans Rees, Leverkusen-I. G.-Werk, Germany, assignor to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application January 30, 1935, Serial No. 4,186. In Germany February 9, 1934
8 Claims. (Cl. 260—99)

1. Process for the manufacture of azo dyestuff which comprises causing an aromatic nitro compound with the exclusion of a p-methyl-nitro compound, a dinitrodibenzyl- and a dinitrostilbene compound to react upon a compound of the group consisting of primary aromatic diamines and aromatic aminohydroxy compounds in a caustic alkaline medium at an elevated temperature.

2,109,184
VEHICLE SIGNAL
Alois T. Sereda, Chicago, Ill.
Application January 4, 1937, Serial No. 119,013
1 Claim. (Cl. 177—324)



A signal device comprising a housing open at its ends, a lens mounted on one end of said housing, a bracket secured in said housing and extending through and beyond the opposite open end thereof, an electric lamp carried by said bracket, a bell secured at one end on said extended portion of the bracket and having an open end arranged in and spaced from the adjacent open end of the housing, a striker complementary to said bell and arranged in the housing, and electro-mechanical means in the housing and on said bracket for actuating the striker.

2,109,185
INTERNAL COMBUSTION ENGINE
Charles H. Thompson, Sacramento, Calif.
Application March 17, 1936, Serial No. 69,392
2 Claims. (Cl. 123—44)

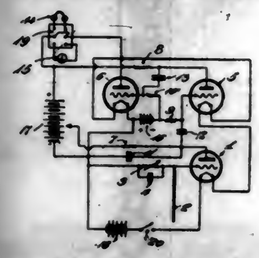
1. A fuel injector for rotary internal combustion engines comprising an injector casing mounted on a stationary part of the engine, a cylinder in one end of the casing having a discharge port therein, said injector cylinder also having a longitudinally aligned end adapted to be connected with a source of fuel supply and a piston operatively mounted within the injector cylinder for drawing fuel from said supply and forcing fuel under pressure through said discharge port, said injector casing having a guide member adjacent the end thereof connected with said source of fuel supply, a valve seat in the injector casing inwardly of the guide, a valve engageable with said seat and having a stem working through said guide and a spring engaged with said stem for yieldably urging said valve in engagement with said seat, said seat being disposed between said system and said valve guide.

2,109,186
THEODOLITE
Curtis H. Veeder, Hartford, Conn.
Application June 4, 1936, Serial No. 83,545
31 Claims. (Cl. 33—72)

1. The combination with a theodolite having a stationary portion constituting a fixed support and a movable portion rotatable about said support on a vertical axis, of cooperating stop means carried by said stationary and movable portions respectively, one of which has supporting means which is horizontally adjustable into a plurality of positions in which the stop means supported thereby is adapted to engage the other in different positions of angular adjustment of said movable portion.

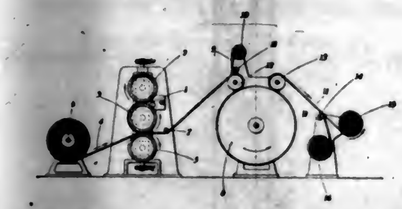
2,109,187
FROSTPROOF HYDRANT
Joseph A. Vogel, Wilmington, Del.
Application October 5, 1936, Serial No. 104,122
10 Claims. (Cl. 137—13)

1. In a frostproof hydrant, the combination of a stand pipe having a water inlet and a drain outlet at its lower end and a discharge nozzle at its upper end, an inlet valve in said pipe movable upwardly to a position in which it opens communication between the inlet and stand pipe for a full flow of water to the nozzle and closes communication between the drain outlet and stand pipe and downwardly to a position in which it closes the inlet and opens communication between the drain outlet and stand pipe, means for operating said valve, and a discharge regulating valve movable with the inlet valve in its upward and downward movement into and out of operative relationship to the discharge nozzle and operative by said operating means in the open position of said inlet valve for gradually regulating the discharge of water through the nozzle.



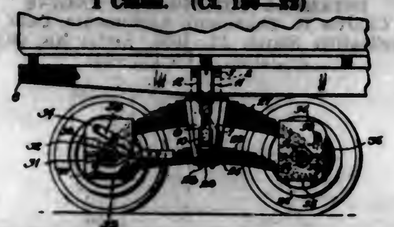
2,109,188
APPARATUS FOR RESTORING MUSCLES IN INFANTILE PARALYSIS
Elizaveta Bajanova, New York, N. Y.
Application October 17, 1936, Serial No. 106,200
6 Claims. (Cl. 272—57)

1. A muscle restoring apparatus comprising a base, a vertically adjustable frame mounted on said base, a body supporting and encircling member, adapted to be secured to said frame, three separate, vertical transverse members mounted



on said base, forming separate foot-compartments, and means for adjusting the amount of separation between said members.

2,109,189
ELECTRICAL TESTING AND DETECTING APPARATUS
Merwyn Bly, Leesburg, Va.
Application April 26, 1937, Serial No. 139,040
8 Claims. (Cl. 175—183)



1. A vacuum tube testing instrument for the detection of electro-magnetic fields adjacent to current carrying wires or other conductors, or objects which have become conductors as a result of proximity to said wires or conductors, comprising: a non-oscillating grid-leak detector including a high impedance grid-leak, an antenna consisting of a substantially straight member of predetermined dimensions connected direct to said grid, an amplifier having one or more stages of amplification connected to said detector, indicating device means connected to the output of said amplifier to indicate the comparative strength and nature of fields being investigated and for detection of said electro-magnetic fields, the impedance of said grid-leak being just low enough to prevent "blocking" of the grid of said detector under conditions where strong fields are being investigated.

2,109,190
METHOD AND APPARATUS FOR MAKING RUBBER ARTICLES
Joseph Herbert Coffey, Rhos-on-Sea, North Wales
Application August 26, 1935, Serial No. 37,976
In Great Britain August 29, 1934
9 Claims. (Cl. 18—6)

1. In the manufacture of a moulded rubber article of indefinite length according to a process utilising a flexible mould supported in roll formation and of a length at least that of the article, the steps of continuously unrolling the mould and causing it to move, continuously feeding plasticised rubber stock to the mould as it moves, continuously vulcanising said rubber while it is still in the mould, and stripping the article from the mould after vulcanization.

2,109,191
SUSPENSION AND DRIVING SYSTEM FOR MOTOR VEHICLES
Francisco Centardi, Buenos Aires, Argentina
Application October 21, 1935, Serial No. 46,044
In Argentina October 24, 1934
1 Claim. (Cl. 180—22)

A suspension and driving system for motor vehicles provided with a main frame and a pair of driving wheels positioned in tandem on each side of the frame; comprising a pair of superimposed springs for each pair of wheels, a bearing box adapted to firmly clamp together said pair of springs, a yoke having cylindrical ends journaled in each of said bearing boxes, a bracket adjacent to each of said bearing boxes and firmly secured both on said yoke and said main frame, each bracket having firm connection with the respective portions adjacent said ends of said yoke, a pair of transverse braces having their lower ends secured in said brackets and their upper ends secured to the main frame, said braces crossing at the middle portion and a clamp engaging said middle portion and said yoke, an axle box for each wheel and rigid longitudinal connection between the axle boxes for each pair of wheels, axle arms for said wheels revolubly mounted in said bearing boxes and differential gears connecting two of said wheels on opposite sides of the frame; whereby the two rearmost wheels of said tandem pairs of wheels have a common differential gear connection, and the two foremost wheels thereof have similar gear connection and each pair of tandem wheels is adapted to oscillate in the same vertical plane around one of said cylindrical ends of the yoke.

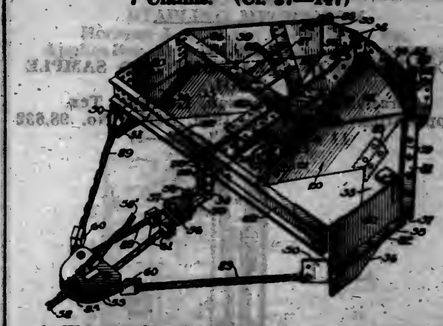
2,109,192
UPRIGHT PIANO ACTION
Clarence B. Davis, Vancouver, Wash.
Application August 6, 1936, Serial No. 94,701
7 Claims. (Cl. 84—240)

1. In a piano action having a hammer, a hammer butt, an action rail, a wippen pivoted thereto, a jack pivotally carried by the wippen and engaging beneath the butt, a spring on the wippen urging the jack into a position beneath the hammer butt and an adjustable stop engageable with the jack upon a predetermined upward movement of the wippen to cause the jack to release its engagement with the hammer butt; means to permit a short stroke of the hammer to be made before the hammer returns to its fully retracted position, including a lower wippen disposed beneath the first named wippen and operatively pivoted to the action rail, a pivoted member carried by the lower wippen and normally engaging against the under face of the upper wippen, a repetition spring carried by the lower wippen and urging the upper wippen upward, a stop carried by the lower wippen extending over the free end of the upper wippen and permitting a predetermined upward movement of the upper wippen with relation to the lower wippen but upon a descent of the lower wippen engaging against the upper wippen to retract it, a stop on the rail limiting the upward movement of the upper wippen, means causing the member to move out of a position in engagement with the upper wippen upon a predetermined upward movement of the lower wippen, and means causing said member to return into

a position of operative engagement with the upper wippen immediately upon a partial downward movement of the lower wippen whereby the upper wippen and jack may again be lifted to drive the hammer against the strings before the hammer has returned to its fully retracted position.

2,109,193
HEEL COVER FOR LADIES' SHOES
Wanda Gene Field and Leslie O. Field, Nappanee, Ind.
Application March 7, 1935, Serial No. 9,898
2 Claims. (Cl. 36—72)

1. A removable and replaceable protective device for the heel of a shoe, said device comprising a shaped covering of self-supporting material conformable to the shape of and to overlie only the back and sides of the heel, laterally inwardly extending flange means on and extending around the upper edge of said covering, said flange means being arranged to engage in the groove defined by the top of the heel and the adjoining structure of the shoe for holding the device on the heel, said flange means including laterally inwardly widened portions at the front ends of said upper edge of the covering.



2,109,194
BRAKE MECHANISM
William A. Gantzel, [illegible], and Thomas R. McGowan, Pittsburgh, Pa., assignors to The American Brake Company, Oglevale, Pa., a corporation of [illegible]
Application May 13, 1937, Serial No. 142,194
11 Claims. (Cl. 188—46)

1. In a brake mechanism for a vehicle having a plurality of pairs of wheels, first and second brake beams applied to opposite sides of one pair of wheels and a third brake beam applied to the side of an adjacent pair of wheels nearest to said first pair, a pair of dead levers operatively connected at their lower ends with said first brake beam adjacent its opposite ends, a first pair of live levers operatively connected at their lower ends with said second brake beam adjacent its opposite ends and operatively connected inter-

mediate their ends with said dead levers, a second pair of live levers operatively connected at their lower ends with said third brake beam adjacent its opposite ends and at their upper ends with the live levers of said first pair, a brake cylinder, and an equalizing lever operatively connected intermediate its ends with said brake cylinder and at its opposite ends with the live levers of said second pair intermediate their ends.

2,109,195
SCRAPER
Leslie P. Green, Chicago, Ill.
Application April 15, 1935, Serial No. 16,989
7 Claims. (Cl. 37—147)

1. The combination with a scraper body of a flexible draft bridle secured at its ends to the sides of said body; a draft frame having two freely moving connections with said bridle, the portion of said bridle between said connections being looped and given a freely moving connection with the central portion of the scraper body; and means for connecting said draft frame with a draft member.

2,109,196
FIRE LADDER AND SAFETY ELEVATOR
Morris Hemig, Bronx, N. Y.
Application November 17, 1936, Serial No. 111,185
2 Claims. (Cl. 227—2)

1. A device of the class described, comprising a safety elevator, wheels mounted thereon, side pieces of a sectional adjustable ladder, said side pieces being U-shaped in cross-section and arranged on a platform, whereby to serve as tracks for said wheels, means for operating the elevator and ladder, said means consisting of a plurality of rope drums, each drum being independently mounted on an axle and serving a separate ladder section, two flanges disposed on the end of each drum and adapted to form a groove, a fork-shaped member inserted into said groove and an

operating rod connected to said fork-shaped member, a pedal adapted to manipulate said rod, a forward driving and a reverse driving gear mounted on the axle, one on each side of the drum, friction clutches attached to the inside of

said gears, cross-bars secured to the lower surface of the elevator, slide shoes arranged on said cross-bars and engaging said tracks, spring actuated means for urging the said shoes to remain on the tracks, and means for the mechanical operation of the device.

2,169,197

COMBINATION CLEAN-OUT AND SAMPLE TOOL

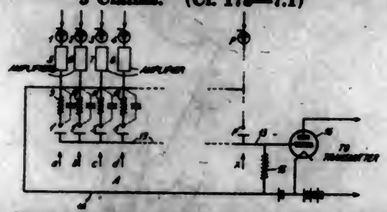
Granville A. Humason, Houston, Tex.

Application August 31, 1936, Serial No. 98,632

11 Claims. (Cl. 166—1)

1. A combination cleanout and sampling device for wells comprising a tool to be located in a well bore, a setting string of pipe connected to said device, a valve member on said tool having a bore communicating with the interior of said string, a body carrying a valve seat threadably connected to said valve member whereby the entry through said valve member to the string may be closed, and the string and tool are anchored against relative rotation when the valve is closed, and spring means to urge said valve and valve seat apart when the threaded connection is released to lift the valve from the valve seat whereby fluid in the well below said tool will enter the string of pipe.

2,169,198



TELEVISION APPARATUS

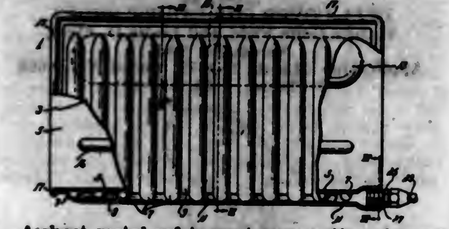
August Karolus, Leipzig, Germany, assignor to Radio Corporation of America, a corporation of Delaware

Application March 23, 1935, Serial No. 12,596

In Germany March 26, 1934

5 Claims. (Cl. 178—7.1)

1. In a television system, a plurality of light translating elements positioned in line formation, an amplifier system connected with each of said elements, said amplifiers each having a time constant circuit associated therewith in the order of the time duration of each scanning line, a load circuit, and an inertialess high speed switching device for sequentially connecting each amplifier with the load circuit.



2,169,199

REFRIGERATING APPARATUS

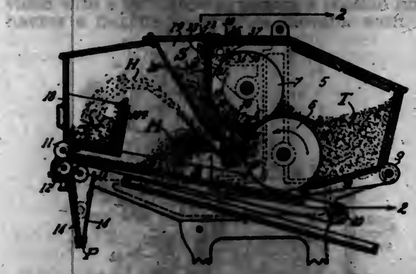
Theodore W. Koerner, Detroit, Mich., assignor, by mesne assignments, to Nash-Kelvinator Corporation, Detroit, Mich., a corporation of Maryland

Application July 2, 1935, Serial No. 29,536

1 Claim. (Cl. 62—126)

A sheet metal refrigerant evaporating element comprising sheet metal material formed to provide inner and outer walls spaced apart for the passage of refrigerant and an inlet opening, one of said walls including material integrally united therewith and having a reversely bent portion forming a rolled bead extending continuously, except for said inlet opening, around the periphery of the said one wall including the four corners thereof, the extreme edge of said reversely bent portion being in uniformly continuous abutting engagement with the peripheral edge of the material forming the other wall and said extreme and peripheral edges being located at sufficient distance from said rolled bead to permit seam welding between the material forming one wall and the return bend of said material and also to permit seam welding between the two walls with the same operation of seam welding.

2,169,200



CIGARETTE TOBACCO FEED

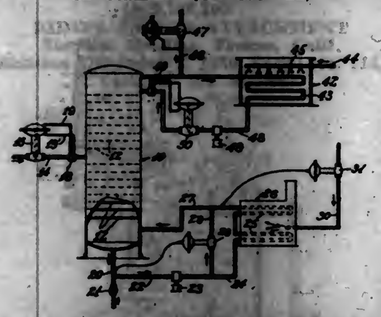
James W. Leary, Bloomfield, N. J., assignor to American Machine & Foundry Company, a corporation of New Jersey

Application April 13, 1935, Serial No. 16,169

20 Claims. (Cl. 131—39)

1. In a cigarette machine tobacco feed, the combination with a source of supply for long shred tobacco, of a source of supply for short shred tobacco, a traveling endless belt, mechanism for removing the long and short shreds from their respective sources of supply and commingling them and depositing the commingled

shreds upon said belt in the form of a continuous stream of tobacco, and means for showering the commingled shreds from said stream on to a continuous wrapper strip whereby a thorough distribution of the short shreds among the long shreds of the tobacco showered upon the wrapper strip will be obtained.



2,169,201

PROCESS AND APPARATUS FOR STABILIZING HYDROCARBONS

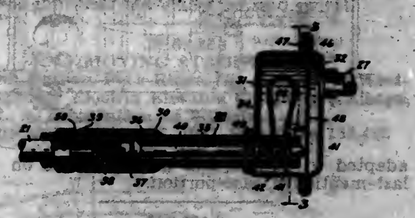
Edward G. Ragatz, Los Angeles, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California

Application July 10, 1933, Serial No. 679,651

11 Claims. (Cl. 196—11)

1. In a method for stabilising gasoline, the steps of withdrawing a portion of the gasoline to be treated from a stabilising zone, heating said withdrawn portion, and returning said heated portion to the stabilising zone, the temperature of the thus re-cycled portion being maintained uniform by regulating the heating in proportion to the temperature of the withdrawn portion and by returning a portion of said withdrawn gasoline directly to said stabilising zone without heating the same.

2,169,202



REFRIGERATING APPARATUS

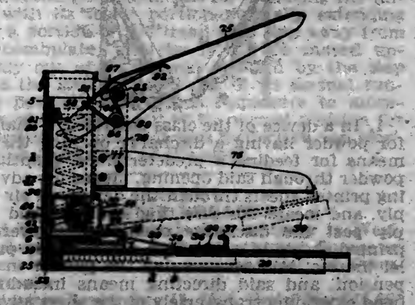
Ethel C. Raney, Cleveland, Ohio, assignor to Ranco Incorporated, a corporation of Ohio

Application August 6, 1935, Serial No. 34,925

6 Claims. (Cl. 62—3)

1. In a refrigerating system, a combination expansion and safety valve for controlling the flow of refrigerant from the high pressure side of the system to the low pressure side thereof, comprising in combination, a valve body having a high pressure chamber adapted to be connected with the high pressure side of the refrigerating system and having a stationary valve seat at the outlet thereof, a valve cooperating with the seat and adapted to open in response to pressure with-

in the chamber, and a resilient thermo-responsive strip disposed within the chamber and biased to be frictionally engaged between a wall of the chamber and a portion of said valve and constructed to act with decreasing or increasing valve closing force on the valve in response to decreasing or increasing temperatures, respectively, of the refrigerant in said chamber.



2,169,203

STAPLING MECHANISM

Herman J. Spencer, West View, Pa.

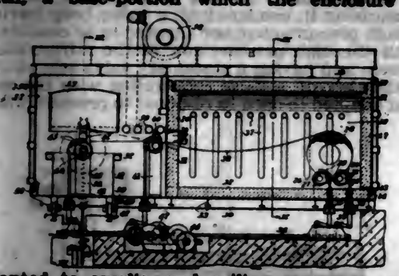
Application May 19, 1934, Serial No. 726,585

25 Claims. (Cl. 1—49)

1. A staple driving mechanism comprising a plunger, mechanism for retracting the plunger away from the work and releasing the same for a staple driving stroke, a compression spring, and means acting on the opposite ends of the spring for compressing said spring during the retracting stroke of the plunger and for assisting in stopping the driving stroke of the plunger by recompressing said spring so as to cushion said stroke, said means connecting said spring and plunger for opposing said spring in such cushioning to further movement of the plunger.

2,169,204

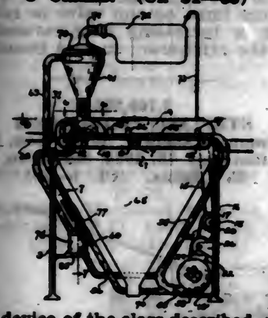
METHOD AND APPARATUS FOR ANNEALING STRIPS



Lee Wilson, Cleveland, Ohio

Application October 16, 1934, Serial No. 748,982

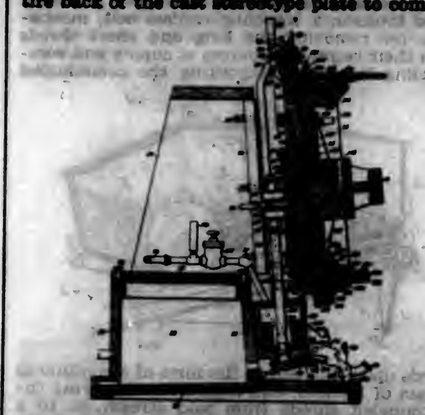
11 Claims. (Cl. 266—3)



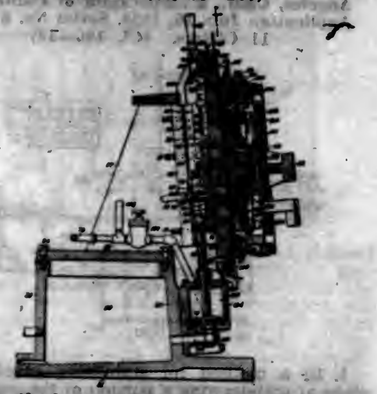
1. Annealing apparatus comprising a base-portion, an open-bottomed furnace cover adapted to be lowered thereover and raised therefrom, an open-bottomed coiling enclosure extending

from one end of said cover and liftable therewith, a base-portion which the enclosure is

adapted to overlie, and coiling means on said last-mentioned base-portion.



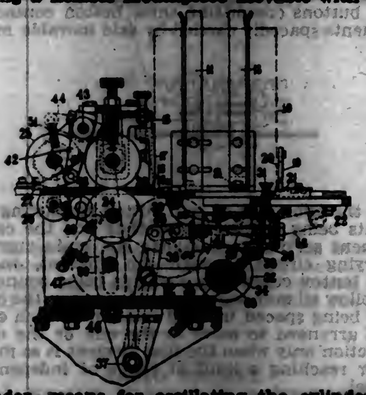
2,109,205
MACHINE FOR PRODUCING RAISED PRINTING
Ralph Woodward, Leicester, Mass.
Application June 4, 1935, Serial No. 24,990
5 Claims. (Cl. 91—59)



1. In a device of the class described, a chamber for powder having a discharge opening therein, means for feeding a predetermined quantity of powder through said opening, means for advancing printed sheets through the device, an air supply, and means for directing air from said supply past the discharge opening and over the printed sheets in a direction substantially parallel thereto, said air carrying the powder in suspension, and said directing means including a hood extending transversely of the sheet advancing means and having an opening in the underside thereof directly above and spaced from a portion of said advancing means extending diagonally across the sheets for uniformly distributing the powder suspended in the air over the sheets.

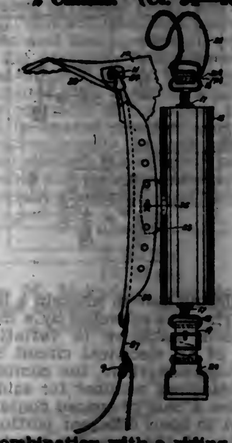
2,109,206
APPARATUS FOR CASTING STEREOTYPE PLATES
George W. Bungay, Brooklyn, N. Y., assignor to Bungaytype-Delaware, Inc., New York, N. Y., a corporation of Delaware
Application June 26, 1935, Serial No. 28,439
19 Claims. (Cl. 22—2)

1. A machine for casting stereotype plates comprising a mold having a mold cavity adapted to receive a matrix against which the stereotype plate is to be cast, and a passage leading thereto through which molten metal is poured, means to close said passage, means to apply pressure to the molten metal to compress the same within the mold cavity and to force the metal into the impressions in the matrix, and yieldable means to distribute pressure over substantially the entire back of the cast stereotype plate to compensate for shrinkage and to hold the plate in pressure engagement with the matrix until and after solidification takes place.



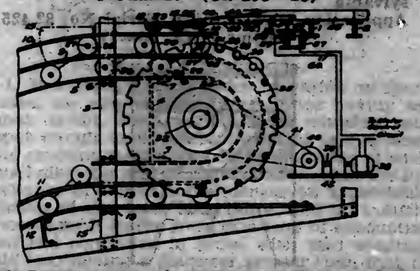
2,109,207
METHOD FOR CASTING STEREOTYPE PLATES
George W. Bungay, Fieldfield, N. J., assignor to Bungaytype-Delaware, Inc., New York, N. Y., a corporation of Delaware
Application September 26, 1934, Serial No. 745,550
5 Claims. (Cl. 22—200)

1. A method of casting stereotype plates in a mold which comprises substantially closing the mold, applying pressure to the molten metal to compress the metal and to force the metal into the matrix impressions, and, before the metal solidifies, applying pressure to the entire back of the cast stereotype plate to hold the plate in pressure engagement with the matrix and to compensate for shrinkage.



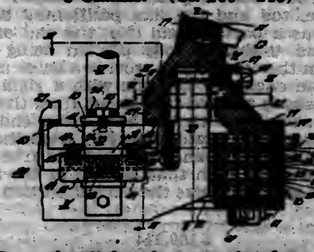
2,109,208
FEEDING OF CARDS OR LIKE ARTICLES FROM A STACK
John Crighton, London, England, assignor to American Machine & Foundry Company, New York, N. Y., a corporation of New Jersey
Application February 6, 1937, Serial No. 124,497
In Great Britain February 12, 1936
14 Claims. (Cl. 271—44)

1. In mechanism for feeding cards, such as the slides of slide and shell cartons, from a stack, wherein a reciprocating tooth feeding device successively feeds the cards from the bottom of the stack, card displacing means comprising a suction cylinder mounted to oscillate toward and from the lowermost card of the stack, and provided with a reciprocable piston, a suction nozzle having a flexible mouthpiece movable with said



cylinder, means for oscillating the cylinder to advance the nozzle into contact with the lowest card and to displace the card into the path of a reciprocating feed tooth, and means synchronized with the cylinder oscillating means for causing relative movement between said oscillating cylinder and its piston to produce the suction effect.

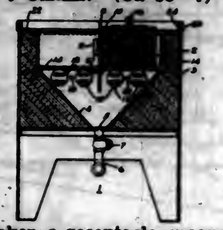
2,109,209
RIDING SADDLE ATTACHMENT
Stephen Douglas, Fresno, Calif.
Application December 2, 1936, Serial No. 114,794
2 Claims. (Cl. 54—46)



1. In combination with a riding saddle having stirrups, of yielding means adapted to suspend the stirrups from the saddle, said yielding means consisting of a tube, a flange within the tube approximately midway between the ends thereof, compression springs within the tube resting against either side of the flange, a rod passing through the tube and springs along the approximate center line of the tube, said rod being provided at either end with a plunger, each plunger being adapted to slide within the tube, and adapted as a nest for the end of the spring, means at one end of the rod to attach the stirrup, means at the opposite end of the rod to engage the thigh of the rider, and a swivel connection adapted to attach the stirrup support to the saddle and to the saddle girth, said swivel connection being adapted to permit the stirrup support to have a limited universal movement on said swivel.

2,109,210
MOVING STAIRWAY
James Dunlop, Park Ridge, Ill., assignor to Westinghouse Electric Elevator Company, Chicago, Ill., a corporation of Illinois
Application June 26, 1937, Serial No. 150,433
6 Claims. (Cl. 198—16)

1. In a moving stairway provided with steps having treads, the combination with a motive means for driving the steps and a combplate disposed at one end of the stairway, of a finger having a feeler portion, means for mounting the finger with its feeler portion normally extending over a portion of the tread of a step away from the combplate, whereby it will be moved upwardly out of its normal position by the step when the step is raised out of its normal running position, and means responsive to movement of the finger out of its normal position for rendering the motive means ineffective and stopping the operation of the steps.



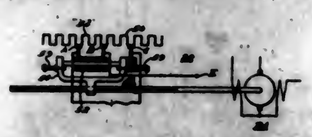
2,109,211
CIRCUIT BREAKER
Lloyd W. Dyer, Swissvale, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application September 12, 1934, Serial No. 743,661
6 Claims. (Cl. 200—146)

1. In a circuit breaker, a pair of spaced nonyielding rigidly supported main contacts of solid material, a rigid member of solid material for bridging said main contacts, a pair of spaced auxiliary contact means mounted adjacent said main contacts and connected in parallel therewith, a bridging member for said auxiliary contact means, a single actuating member for moving said rigid member and said bridging member into

and out of engagement with their respective cooperating contacts, said rigid member being resiliently mounted upon said actuating member for relative movement longitudinally with respect thereto and to said bridging member, and guide means associated with said actuating member for preventing rotational movement of said rigid member relative to said actuating member and for determining the amount of relative longitudinal movement of said rigid member with respect to said actuating member.

2,109,212
TWO-COMPARTMENT FRY KETTLE
Karl Kergeti, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 29, 1936, Serial No. 82,425
6 Claims. (Cl. 53—7)

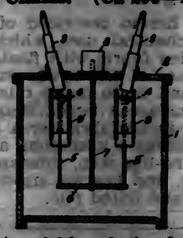
3. In a cooker, a receptacle, means removably secured in place for dividing it into compartments, a heater and a thermostat in each compartment, whereby the temperature of each compartment may be individually determined, means for supporting articles to be cooked in any compartment, said means when the dividing means are removed serving to support articles in the united compartment.



2,109,213
CLIP
Allen C. Fearing, South Weymouth, Mass., assignor to United-Carr Fastener Corporation, Cambridge, Mass., a corporation of Massachusetts
Application October 24, 1936, Serial No. 107,412
1 Claim. (Cl. 24—73)

A clip of the class described comprising a strip of metal bent into a generally U-shaped body, wire, tube, rod and the like positioning means provided as a part of said clip, the end of one leg of said U-shaped body portion being bent away from the other leg to provide a guide means assisting in engaging said clip with a rigid support and sharp pointed prongs cut from the material of said leg with the bent away end and said prongs being located inwardly from the end of the bent portion and having their free ends about in a plane with that portion of the inner surface of said leg where the curved portion joins the leg.

2,109,214
REGULATOR RHEOSTAT
Edwin L. Harder, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 13, 1935, Serial No. 54,256
7 Claims. (Cl. 201—55)

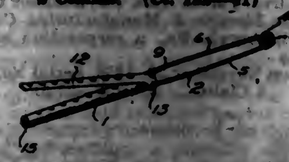


1. In a rheostat comprising a single tapped resistor, a plurality of stationary contact buttons respectively connected with the resistor taps and spacedly arranged in a single row, and a member adapted to be moved in successive contact register with said buttons to thereby adjust the rheostat resistance, the combination of means for giving steps of adjustment substantially smaller than those determined by the resistor sections connected between adjacent of said contact buttons comprising three button contacting elements spacedly carried by said movable member, the two outer of said button contacting elements being connected together and the center element serving to complete the main current-carrying circuit through the rheostat, one of said button contacting elements being connected to follow all movements of said member, the other two being spaced in fixed relation to each other and arranged to move in the one or the other direction only when the first element is so moved after reaching a limit of range of independent travel.

2,109,215
REGULATING SYSTEM
Edwin L. Harder, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 24, 1935, Serial No. 56,013
9 Claims. (Cl. 171—229)

1. In a regulating system wherein a tapped-resistor type of rheostat operated by a motor controlled by means sensitive to variations in a characteristic of an electrical circuit is utilized to adjust said characteristic, the combination of a resistance-adjusting member for said rheostat which comprises a pair of spaced contacting elements adapted to span different portions of like resistance value of the rheostat resistor, and a vibrating-contact regulator, separate from the rheostat motor control means and sensitive to said characteristic, disposed to establish and interrupt at closely spaced time intervals and in adjustable-ratio manner a shunt connection around the resistor portion between the spaced contacting elements to thereby control the circuit characteristic within a range determined by the spanned portion of said rheostat resistor.

2,109,216
ARC-EXTINGUISHING DEVICE
John W. Halstetter, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application September 20, 1930, Serial No. 483,235
Renewed January 16, 1935
26 Claims. (Cl. 200—147)

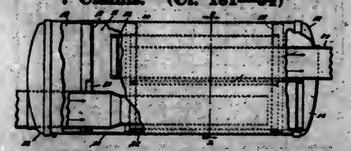


1. In an extinguishing device for arcs in air, a gas-evolving solid provided adjacent to the arc path, said gas-evolving solid being movable and biased into intimate engagement with the arc.

2,109,217
RADIO SOCKET
Carl L. Knudsen, Maywood, Ill., assignor to Cinch Manufacturing Corporation, Chicago, Ill., a corporation of Illinois
Application February 22, 1934, Serial No. 712,459
6 Claims. (Cl. 173—328)

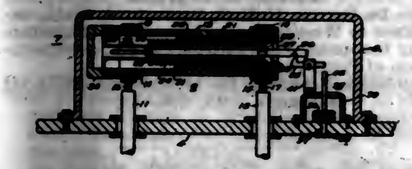
1. A socket of the class described comprising, in combination, a plurality of superposed apertured plates arranged with their apertures in alignment, contact members assembled between said plates and having portions passing through some of the apertures and with all parts thereof located entirely below the top plate, one of said apertures and contacts being located substantially centrally of the plates with the others arranged in spaced relation about it and rivet means concentrically located with relation to said center contact for securing said plate members together and providing the only means passing through the top plate and holding it against rotation.

2,109,218
CURLER
Ross M. McFadden, Glendale, Calif.
Application October 14, 1935, Serial No. 44,859
2 Claims. (Cl. 132—41)



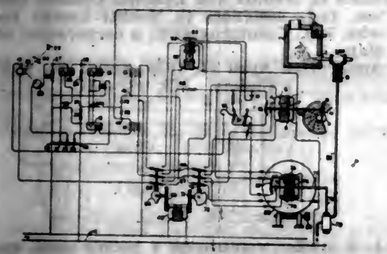
1. In a curling device, an open ended curler body, a swingingly mounted clamp adapted to be swung to a position longitudinally of the body with its outer end overlying the outer end of said body, and a resilient disc roller with a transversely curved periphery rotatably mounted on the outer end of the clamp being compressible to facilitate movement to clamping position and automatically centered upon such engagement by the curved peripheral contact with the open body end without entirely closing the end of said body.

2,109,219
ANTENNA COUPLING DEVICE FOR FIVE METER RECEIVERS
Percy De Forrest McKeel, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application February 14, 1935, Serial No. 6,532
8 Claims. (Cl. 250—20)



1. In a system adjusted for operation on short waves, an electron discharge device having an input circuit, coupling means for coupling said input circuit to another portion of said system, said coupling means comprising a winding of such small diameter and of such few turns that the inductance of two adjacent turns is an appreciable portion of the total inductance, and an inductance element in the form of a loop of conductive material connected in series with said winding, said loop having a diameter greater than that of said winding such that distances along said loop may constitute appreciable increments of inductance, and means for connecting said other portion of the system to a point on said inductive loop.

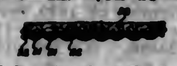
2,109,220
MUFFLER
Quintin G. Noblitt and Edmund Ludlow, Columbus, Ind., assignors to Noblitt-Sparks Industries, Inc., Columbus, Ind., a corporation of Indiana
Application April 11, 1936, Serial No. 73,819
7 Claims. (Cl. 181—54)



1. A muffler, comprising a hollow shell, spaced transverse partitions within said shell, end heads for said shell spaced outwardly from said partitions to provide passages for transversely flowing gases, a pair of cups extending longitudinally of the shell between said partitions and opening respectively into said transverse passages, open-ended silencing tubes disposed respectively within said cups and connected through the open ends thereof one with a gas-supply conduit and the other with an outlet pipe, and a third silencing tube extending between said partitions and interconnecting said transverse passages, each of said silencing tubes being provided with a multiplicity of distributed openings each providing restricted communication between the interior of the tube and the space around it, each of said cups being provided between said partitions with a plurality of distributed openings each affording restricted communication between its interior and the space within the shell, at least one of said cups being additionally provided near its closed end with perforations interconnecting the interior of the cup with the adjacent transverse passage.

2,109,221
ELECTRICAL APPARATUS
Henry V. Putman, Sharon, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application February 14, 1934, Serial No. 711,132
2 Claims. (Cl. 200—81)

2. In a protective system for an encased electrical apparatus, the combination of a device adapted to interrupt the apparatus energizing circuit comprising a spring-actuated plunger, a latch for holding said plunger in a circuit-closing position against the action of said spring, means for releasing said latch when the pressure within the apparatus casing exceeds a given value, and a fusible link positioned between the plunger and the latch, said link being adapted to rupture when the flow of current through the device exceeds a given magnitude.

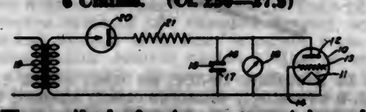


2,109,222
MEASURING AND CONTROLLING APPARATUS
John D. Ryder, Cleveland Heights, Ohio, assignor to Bailey Meter Company, a corporation of Delaware
Application March 31, 1934, Serial No. 718,427
30 Claims. (Cl. 236—69)

4. In combination, a photocell, a plurality of electron discharge devices each having an input and an output circuit, the magnitude of the current passed by said photocell differentially selectively controlling the energization of said input circuits, operating mechanism actuated by the current in said output circuits, and means under the control of said operating mechanism for varying the current flow through said photocell.

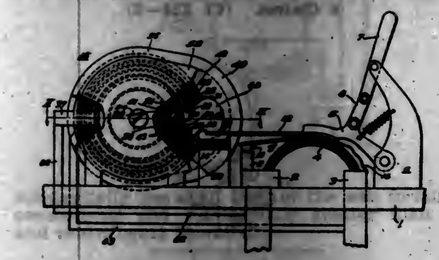
7. In a control system, in combination, means for applying an agent to produce or maintain a predetermined condition, fluid pressure actuated control means for varying the rate of application of the agent, a plurality of electron discharge devices each having an input and an output circuit, said control means positioned by changes in current in the output circuits, and photo-sensitive means responsive to departure from the predetermined condition for controlling the input circuits in accordance with the rate of change of said condition from or toward the predetermined value.

2,109,223
WOVEN FABRIC
Hartman F. Schmidt, Unionville, Conn.
Application January 2, 1935, Serial No. 131
1 Claim. (Cl. 28—1)



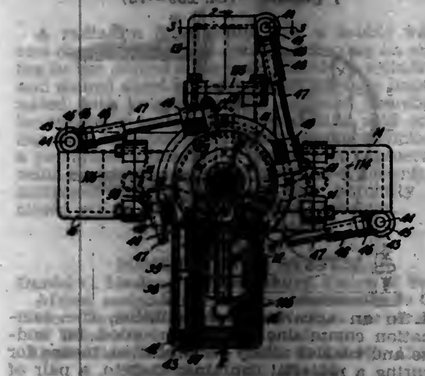
The method herein described of producing a fabric for mechanical uses which consists in weaving a woolen fabric with floats, teasing the float-bearing face of the newly woven and unfulled fabric, and in so doing raising upon the float-bearing surface a lanky, shaggy pile, then fulling the pile-faced fabric for a period of two hours and a half as a minimum, and producing a stiff and board-like web, substantially smooth on one surface, and bearing upon the opposite surface a deep and felted pile.

2,109,224
LIQUID PUMP
Thomas L. Titus, Cheyenne, Wyo., assignor to The Wyott Manufacturing Company, Cheyenne, Wyo., a corporation of Wyoming
Application June 1, 1937, Serial No. 145,648
10 Claims. (Cl. 221—102)



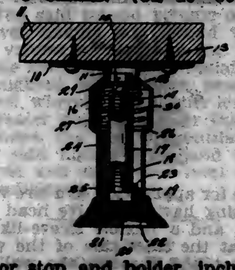
1. In a liquid dispensing pump, in combination, a housing, a vertically reciprocable cupped cylinder within the housing, a liquid chamber around the cylinder within the housing, an outlet in the bottom of the housing, a piston reciprocable within the cylinder, means operable through said outlet for raising the piston, passages in the bottom of the cylinder in open communication with said outlet but having means to open said passages to communication with the chamber when the cylinder is raised and to close said passages against said communication with said chamber when the cylinder is at its lowest position.

2,109,225
MEANS FOR AGING VACUUM TUBES
Dayton Ulrey, Forest Hills, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application November 28, 1936, Serial No. 113,159
6 Claims. (Cl. 250—27.5)



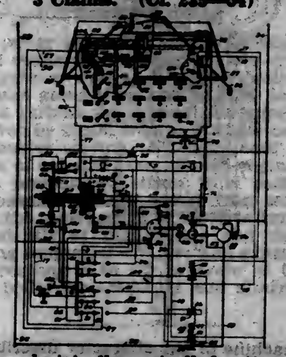
1. The method of aging vacuum tubes which comprises establishing a vacuum therein and causing a series of flashovers between electrodes in the vacuum without heating current applied to the cathode.

2,109,226
CIRCUIT BREAKER
Walter M. Austin, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 30, 1933, Serial No. 651,533
20 Claims. (Cl. 200—147)



1. In a circuit interrupter, a plurality of concentric cylindrical members of conducting sheet material, means for establishing an arc adjacent said members, and each of a plurality of said cylindrical members having a helicoidal projecting portion extending toward said means for establishing the arc for receiving the arc therefrom and providing a path over which the arc may be moved into said cylindrical members.

2,109,227
POWER TRANSMITTING MECHANISM
Andrew Hoover, Wheaton, Ill.
Application June 19, 1935, Serial No. 27,281
4 Claims. (Cl. 192—30)

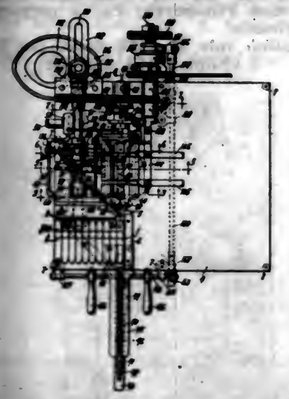


1. In a power transmitter of the character described, the combination with rotatable driving and driven members; of a substantially cylindrical housing provided with a plurality of radially disposed cylinders and secured to one of said members, each of said cylinders having its inner end extended radially inwardly of the cylindrical surface of the housing; a plurality of pistons, one for and cooperable with each cylinder, operatively connected to the other of said members, each cylinder being provided with outlet and inlet ports and an air passage common to both of said ports, said air passage having an open end terminating in spaced relation inwardly of the cylindrical surface of the housing.

2,109,228
DOOR STOP AND HOLDER
Arnold W. Carlson, Lewistown, Pa.
Application August 28, 1937, Serial No. 161,520
6 Claims. (Cl. 16—86)

1. A door stop and holder, including a base for attachment to a base board, a two-part shell, one section of which has free rocking engagement with the base at all times, the other section having telescopic engagement with the first named section, a spring urging the sections outward relative to each other and resisting inward movement of the outer section, and a suction cup attached to the outer end of the second named section.

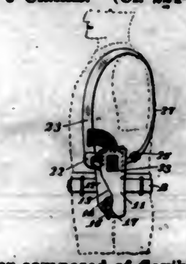
2,109,229
ELECTRIC CONTROL MECHANISM FOR VOTING MACHINES
Willard G. Cook, Forest Hills, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application July 30, 1932, Serial No. 626,491
3 Claims. (Cl. 235—54)



3. In an electrically controlled voting machine a judge's controller for placing the machine in operative condition so that a voter may vote, means controlled by said judge's switch to prevent the judge from interfering with the voting operation, a motor for operating the machine, a voter's controller for starting the motor to place the machine in condition to receive the votes, means for stopping the motor after the machine is in voting condition, a vote interlock, means responsive to the operation of the voter's controller to place said interlock in an inoperative position, a plurality of candidate levers, a plurality of party levers, means responsive to the operation of at least one of said candidate levers or the proper operation of one party lever to place the interlock in operative position, and means responsive to the voter's controller adapted to start the motor to complete the voting operation.

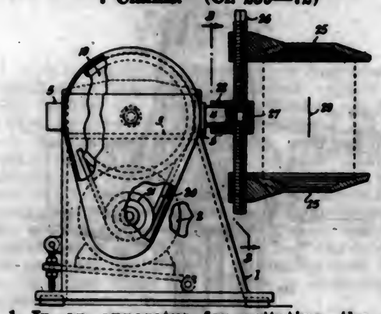
2,109,230
FILTERING VALVE AND THE LIKE
Theodore A. Hammond, Upper Montclair, N. J.
Application July 25, 1934, Serial No. 736,868
8 Claims. (Cl. 183—41)

3. A device for application to a tire valve, comprising a casing having a valve head and valve seat therein, and a flexible sleeve-like filter in said casing at the inlet side of the valve head and valve seat and through the wall of which sleeve the air must pass to reach said valve head and valve seat, said filter having one end thereof fixed with respect to the valve seat and having its other end fixed to and movable with the valve head.



2,109,231
MACHINE FOR LOADING WRAPPERS OR POUCHES
Isaac A. Hardy, Evansville, Ind., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application January 9, 1930, Serial No. 419,701
18 Claims. (Cl. 226—2)

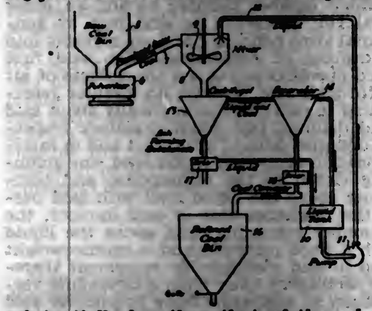
1. A machine of the character described comprising suction holding means movable into contact with opposite sides of a pouch-like container and separable to open one end thereof, a combined guide and spreader comprising a pair of opposite blades having tapering ends normally in contact with each other and movable into the mouth of the container by the passage of a load therebetween, means whereby movement of said blades into the mouth of the container causes said blades to separate and to hold said mouth in open position, and means to load the container while held in open position.



18. In a machine, the combination of a magazine for pouches, a movable tranafer drum having suction openings on its face, means to maintain a partial vacuum thereon during a portion of the rotation of the drum, means to feed pouches on to the drum, means for opening the pouches while so held, a loading device operable while the pouch is opened, and means to relieve the vacuum after the loading operation and to remove the loaded pouch.

2,109,232
HOLSTER
Richard H. Heyt, Los Angeles, Calif.
Application November 18, 1935, Serial No. 50,310
6 Claims. (Cl. 224—2)

1. A holster composed of flexible material bent double to form inner and outer walls, the upper portion of the inner wall being provided with a plurality of vertically disposed slots for the reception of a supporting member, an inverted U-shaped spring imbedded in the upper portion of each wall of said holster and the lower ends of the members forming one pair of the vertical legs of said springs being connected to one another.

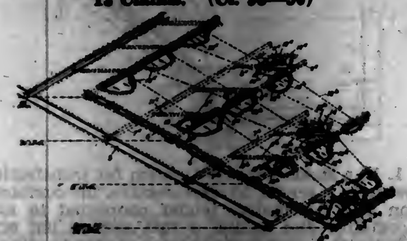


2,109,233
PAINT AND LIQUID MIXER
Arthur P. Jergenson, Racine, Wis., assignor to Ream Manufacturing Company, Racine, Wis., a corporation of Wisconsin
Application November 16, 1936, Serial No. 110,987
7 Claims. (Cl. 259—72)

1. In an apparatus for agitating, the combination comprising a shaft mounted for endwise and coaxial-rotary reciprocation, means for securing a material container thereto, a pair of rocker-arms secured to said shaft, a uniformly rotating drive shaft having an eccentric portion, and a cross-block engaging the ends of said rocker-arms and the eccentric portion of said drive shaft, whereby uniform circular motion of said drive shaft is communicated in the form of endwise and coaxial-rotary reciprocation to said reciprocable shaft.

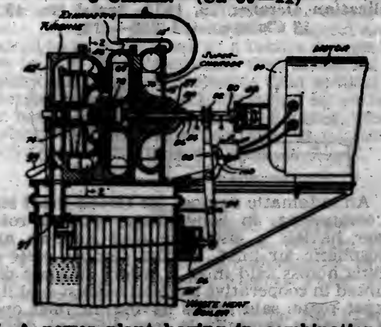
2,109,234
CENTRIFUGAL ASH SEPARATION
Walter M. Keenan, Fieldston, N. Y.
Application July 15, 1935, Serial No. 31,538
8 Claims. (Cl. 233—1)

2. Process of treating coal to remove ash forming constituents therefrom which comprises mixing the coal with an organic liquid having a boiling point of less than 212° F. and a specific gravity



substantially less than that of the ash forming constituents and substantially greater than 1, and centrifuging the mixture.

2,109,235
RADIATION FILTER AND METHOD FOR UTILIZING THE SAME
Hermann Kott, East Orange, N. J., assignor, by mesne assignments, to Ion Corporation, Short Hills, N. J., a corporation of New Jersey
Application June 29, 1935, Serial No. 29,695
1 Claim. (Cl. 250—84)



A radiation filter comprising a double walled and domed cylindrical container having an opening in the domed outer wall thereof, a cylindrical and domed sheet of regenerated cellulose impregnated with cobalt chloride enclosed thereby, a hermetically sealed chamber closing said opening from the atmosphere said chamber enclosing a perforated container, a quantity of regenerated cellulose within said container and a gaseous atmosphere having a determined humidity enclosed within said chamber and container.

2,109,236
MINE COOLING SYSTEM
Daniel C. Lindsay, Johannesburg, Union of South Africa, assignor, by mesne assignments, to Carrier Corporation, Newark, N. J., a corporation of Delaware
Application March 21, 1935, Serial No. 12,158
13 Claims. (Cl. 98—50)

1. The method of conditioning and ventilating a mine having a plurality of levels, a lower level having less volumetric air capacity than a higher level which comprises drawing air into said lower level of said mine, conditioning said air, discharging the conditioned air into the working passages of said lower level, drawing a second volume of air into said higher level of said mine, conditioning said second volume of air on said higher level, mixing said second volume of air with the volume of air from the working passages of the lower level, and circulating said mixture throughout the working passages of said higher level, whereby said higher level is supplied with a greater quantity of air than said lower level to meet the greater ventilation requirements of said higher level, and whereby said higher level and said lower level are each desirably conditioned.

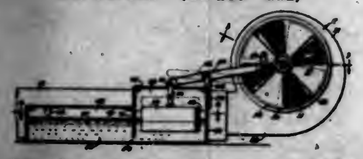
2,109,237
POWER PLANT
Ludwig Lustig, Manhasset, N. Y.
Application June 25, 1934, Serial No. 732,196
8 Claims. (Cl. 60—11)

1. A power plant having in combination, an internal combustion engine, a super-charger for said engine, a waste heat boiler utilizing heat in exhaust gases from said engine to produce steam, a turbine for driving said super-charger and driven by steam from said waste heat boiler, an exhauster serving to reduce both the back pressure of exhaust gases of said engine and the exhaust pressure of steam from said turbine, said exhauster utilizing energy from said turbine to drive the same and an alternative device driven independently of said engine and turbine for actuating said super-charger and exhauster, and means responsive to the pressure of the steam in said boiler for actuating said alternative device.

2,109,238
HYDRAULIC JACKING SYSTEM FOR VEHICLES
Donald Wilfred Sessions, Willesden, London, England
Application November 19, 1935, Serial No. 50,530
In Great Britain October 16, 1935
8 Claims. (Cl. 60—52)

1. In a hydraulic jacking system for a motor vehicle and in combination, hydraulic jacks se-

cured beneath the vehicle, a reservoir for containing a liquid for operating said jacks, a pump operable to draw liquid from said reservoir and to deliver the same to said jacks under pressure to actuate said jacks, a valve variously operable when said pump is at rest to prevent the return of liquid delivered by the pump and to by-pass the delivered liquid back into the reservoir to release said jacks, a clutch operable to connect the pump to the engine drive, an electrical signal for indicating when the pump is clutched to the engine drive, a circuit for said signal prepared in part by the closure of the engine ignition circuit, and manually controlled means for operating said clutch, closing said valve, and completing said signal circuit.



2,109,239

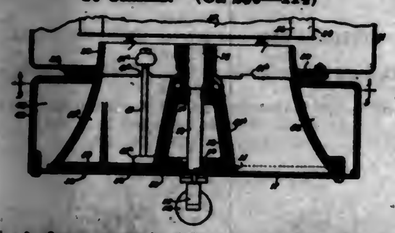
AIR CONTROL MEANS FOR COMBUSTION APPARATUS

Clark Scholl, Springfield, Ohio, assignor to The Steel Products Engineering Company, Springfield, Ohio, a corporation of Ohio

Application October 19, 1935, Serial No. 45,776

13 Claims. (Cl. 230—114)

1. An automatic damper for forced-draft stokers comprising, in combination with a rotary blower having a discharge duct and an axial atmospheric air inlet, a fixed damper plate extending across said inlet, a rotary damper plate mounted in cooperative relation against said fixed damper plate, said plates having air inlet openings movable respectively into different degrees of registration to define the effective air inlet area, and means located outside of said duct for automatically adjusting said rotary plate to increase and decrease said air inlet area respectively in accordance with increases and decreases in the static pressure of the air discharged from said blower.



2,109,240

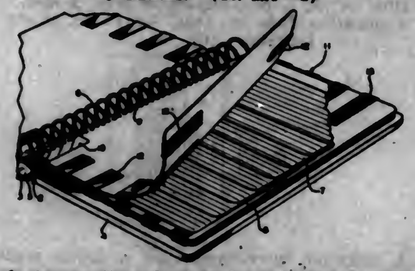
AIR CONTROL MEANS FOR COMBUSTION APPARATUS

Clark Scholl, Springfield, Ohio, assignor to The Steel Products Engineering Company, Springfield, Ohio, a corporation of Ohio

Application November 15, 1935, Serial No. 49,862

10 Claims. (Cl. 230—114)

1. A damper comprising, in combination with an air-flow passage, a fixed damper member defining a plurality of sector-shaped annularly spaced openings in a plane and separated by closed areas, a shaft supported axially of said member, a movable damper member mounted over said fixed damper member and having a central hub rotatably supported on said shaft, said movable damper member having an outer peripheral rim connected to said hub by generally radial arms defining openings movable into various degrees of registration with said first mentioned openings to control the volume of air flowing through said passage, an annular reservoir secured to said rim concentrically about said shaft and defining two liquid chambers respectively at opposite sides of said shaft and in intercommunication below the liquid level, one chamber being closed to the atmosphere and communicating above the liquid level with said passage at the discharge side of said damper, the other chamber communicating above the liquid level with a fixed pressure, and a counterweight connected to said reservoir for movement therewith and oscillatory away from a depending vertical position as said arms move to uncover said openings.



2,109,241

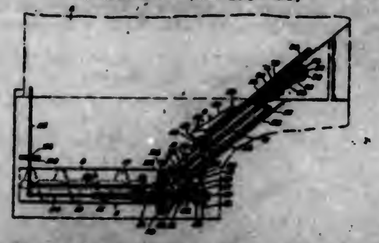
LOOSE LEAF BINDER

John Howard Talmage, Chicago, Ill., assignor to Wilson-Jones Company, Chicago, Ill., a corporation of Massachusetts

Application September 16, 1935, Serial No. 40,707

6 Claims. (Cl. 129—1)

1. An equalizer sheet for loose leaf binders having its top and bottom edges each provided with a series of strips adhered thereto, the series of strips at one edge being laterally spaced alternately of the strips at the opposite edge.



2,109,242

FUEL FEEDING DEVICE FOR LOCOMOTIVES OR THE LIKE

Edgar M. Wilcox, Chicago, Ill., and Alexander M. Stockwell, Elkhart, Ind.

Application June 22, 1935, Serial No. 27,996

6 Claims. (Cl. 198—15)

1. In a stoker conveyor system for transferring fuel from a tender to a locomotive, the combination of a locomotive tender connected to said locomotive and having a fuel storage bin provided with a rear slope sheet, a stoker for transferring fuel from said bin to said locomotive, a

reciprocating fuel pusher mounted for movement with respect to the surface of said slope sheet for transferring fuel disposed thereon toward said stoker, a stoker engine, a drive extending from said stoker engine, means connected to said drive for operating said stoker, means connected to said drive for operating said fuel pusher, clutch means in said last-named means for controlling said fuel pusher, and means operated by the operation of said fuel pusher operating means at the ends of the pusher stroke for controlling the operation of said clutch means for stopping the movement of said fuel pusher.

2,109,243

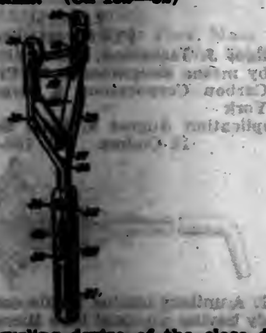
FURNACE

John Valentine Weisiger, Indianapolis, Ind.

Application September 5, 1935, Serial No. 39,198

4 Claims. (Cl. 110—175)

1. In a furnace having a fire-pot provided with a laterally extending throat, a door closing the outer end of said throat, a box secured to the inner face of said door, said door being provided with openings admitting air to said box, a sleeve vertically slidable in said box and communicating therewith, the upper end of said sleeve sloping downwardly and inwardly of said throat, a conduit mounted in said throat with its outer end disposed above said sleeve when the door is closed, said conduit extending into said fire-pot and being there provided with air-discharge openings, and a member mounted for vertical sliding movement in the outer end of said conduit and projecting therebelow to engage and seat upon the upper end of said sleeve, said member having a passage providing communication between said sleeve and conduit when the door is closed.



2,109,244

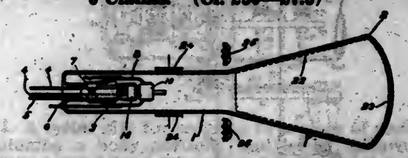
INSTRUMENT FOR CURLING THE LASHES OF AN EYE

Frank Zaglosk, New York, N. Y.

Application May 31, 1935, Serial No. 24,296

11 Claims. (Cl. 132—32)

1. An eyelash curling device of the class described comprising a handle member, a stationary frame projecting from said handle member and having an arc-shaped curling element transversing the outer end portion of said frame, a curved curling element slidably supported in said frame, and means for guiding said element in a circumferential path with respect to one surface of said stationary curling element.



2,109,245

VACUUM TUBE

Vladimir K. Zworykin, Swissvale, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania

Application November 16, 1929, Serial No. 407,652

6 Claims. (Cl. 250—27.5)

1. A cathode-ray tube including an electron-source and a first anode, a fluorescent screen and means, including said screen and a second anode adapted to be maintained at a higher voltage relative to said source than said first anode for establishing a convergent electric field around the major portion of the path traversed by an electron between said source and said screen, whereby electrons from said source may be focused to a well defined spot on said screen.

2,109,246

DENSE NONMETALLIC BODIES

John A. Boyer and Carl G. Ross, Niagara Falls, N. Y., assignors, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

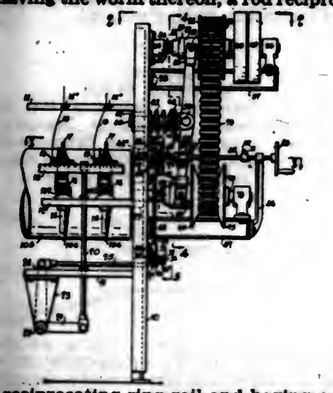
Application July 28, 1936, Serial No. 93,039

6 Claims. (Cl. 75—137)

1. A molded and shaped article in which the principal ingredient is silicon carbide, the said silicon carbide being embedded in a boron carbide matrix.

2,109,247

VARIABLE SPEED DRIVE FOR DRAFTING MACHINERY



James R. Clay, Granite Falls, N. C., assignor of one-half to Perry L. Moore, Granite Falls, N. C.

Application June 18, 1937, Serial No. 148,962

1 Claim. (Cl. 112—32)

In a spinning frame, twisting frame and the like having a reciprocating ring rail, a drive shaft, a driven shaft for driving the frame, a conical disk fixed on the drive shaft, a second conical disk fixed on the driven shaft, a sliding conical disk keyed for sliding movement on each of said shafts and each having its conical face disposed reversely to the conical face of the fixed conical disks to thereby provide a grooved pulley on each of the shafts, a lever having its ends connected to said sliding disks, a bolt slidably penetrating a portion of the frame, resilient means normally forcing said bolt away from said frame, means pivotally connecting an intermediate point of said lever with said bolt, a member penetrating one end of said lever and having a worm gear

threadedly secured on one end thereof, a shaft having a worm thereon meshing with said worm gear, a ratchet wheel on the other end of said shaft having the worm thereon, a rod reciprocable

by the reciprocating ring rail and having a pawl for engaging said ratchet wheel and whereby said lever is moved and said sliding disks are moved in opposed directions to vary the relative speeds between the drive shaft and the driven shaft.

2,109,248

HEADWEAR

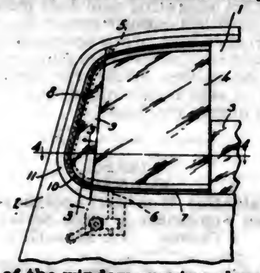
James R. Hibshman, Cleveland Heights, Ohio, assignor to Harold V. Ensten

Application November 9, 1936, Serial No. 109,833

18 Claims. (Cl. 66—171)

8. The process of making a headwear having depending flaps for the neck which comprises rack-knitting a flat substantially V-shaped strip of material having forward inside opposed edges and rear outside edges, and joining the rear outside edges of the V-shaped strip from the outside tip thereof for a substantial distance sufficiently to cover the rear of the head.

2,109,249



VENTILATING WINDOW

John G. Hickman, Detroit, Mich., assignor to Ternstedt Manufacturing Company, Detroit, Mich., a corporation of Michigan

Application August 12, 1935, Serial No. 35,689

3 Claims. (Cl. 296—44)

1. In a vehicle body having a window opening, a panel mounted in the window opening and pivoted between its front and rear edges to swing about a vertical axis to provide an open space between the portion of the glass forward of the pivots and the forward edge of the window opening, the front edge of the said window panel engaging the forward edge of the window opening when the said panel is swung to closed position, and an auxiliary panel mounted along the forward edge of the window opening along the outside of, and spaced from, the swinging panel whereby when the swinging panel is swung to ventilating position the swinging panel and auxiliary panels cooperate to form a passageway for ventilating air currents.

2,109,250

PROCESS FOR REDUCTION OF CONTAMINATION BY METALS IN CAUSTIC ALKALI SOLUTIONS

Albert H. Hooker, Lewiston, N. Y., assignor to Hooker Electrochemical Company, New York, N. Y., a corporation of New York

No Drawing. Application November 29, 1933, Serial No. 700,361

4 Claims. (Cl. 23—184)

1. The process of preparing commercial solid, substantially anhydrous caustic alkali which, upon dissolving the same in water to make up a 60 to 100 percent saturated solution thereof, allowing said solution to cool and settle and separating the solution from the sludge, will automatically produce a solution of relatively low iron content, which process comprises adding a small quantity of finely divided asbestos fiber to caustic alkali of relatively high iron content while said caustic alkali is in fused condition and allowing said caustic alkali to cool and solidify.

2. As a new article of commerce, solid, substantially anhydrous caustic alkali containing a small quantity of finely divided asbestos fiber.

2,109,251

FLUID MIXER

Wilgot J. Jacobsson, Elizabeth, N. J., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York

Application August 8, 1934, Serial No. 738,924

12 Claims. (Cl. 158—27.4)

1. A unitary mixing nozzle comprising a nozzle body having an axial bore therethrough with an enlarged cavity at the rear end of the bore, and an injector nozzle fitted in the cavity in said nozzle body, said injector nozzle having a part thereof spaced from the wall of the cavity and from the rear end of the bore to provide a chamber communicating with the bore, said mixing nozzle having therein a port communicating with the chamber, the axial bore through said mixing nozzle and the passage through said injector nozzle providing means for passage of a gas through said mixing nozzle, said nozzle body having therein a longitudinal passage substantially parallel to the bore, the longitudinal passage in said nozzle body providing means for passage of a second gas through said mixing nozzle to the forward end thereof for mixing with the first gas.

2,109,252

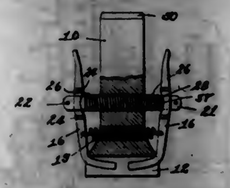
BLOWPIPE

Wilgot J. Jacobsson, Elizabeth, N. J., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York

Application August 8, 1934, Serial No. 738,925

2 Claims. (Cl. 158—27.4)

1. A blowpipe, for producing flame of varying intensity, comprising a handle; a chamber at the forward end of said handle having inlets for acetylene, inlets for air, and an outlet constituting a mixing throat, said air inlets being adjacent the entrance to said throat; a nozzle adapted to direct a jet of oxygen through a portion of said chamber and into said mixing throat to aspirate acetylene and air into said throat with the oxygen jet; a valve on said handle for controlling the flow of oxygen to said nozzle; said handle being provided with another valve, manually adjustable and independent of said oxygen valve, for varying the amount of acetylene admitted to said chamber whereby the volume of air admitted automatically varies inversely to the volume of acetylene admitted thereby to maintain constant the volume of mixed gases aspirated by said oxygen stream.



2,109,253

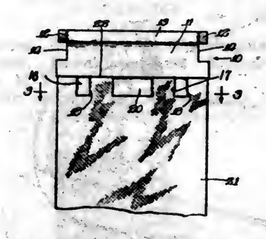
STAMPING TOOL

Welding Johan Kolstad, Hyde Park, Mass.

Application December 8, 1936, Serial No. 114,790

3 Claims. (Cl. 101—23)

1. A stamp holder for the purpose specified having a body portion provided at one end with a slot for the reception of a plurality of stamping members, clamping means for holding the stamp members in the slot and a resilient mounting for securing the clamping means to the body portion.



2,109,254

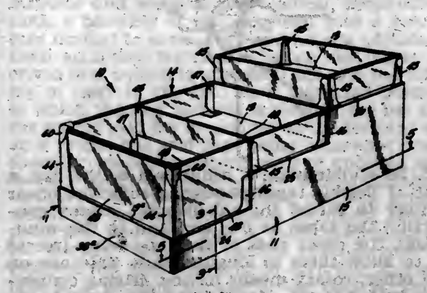
FASTENING DEVICE

Joseph Landgraf, Chicago, Ill.

Application August 27, 1936, Serial No. 98,184

6 Claims. (Cl. 282—29)

1. A metal clip for securing to a piece of cloth, including a body portion, and cloth securing means comprising a plurality of T-shaped fingers each having a head and a body portion extending from the body portion of the clip, said fingers formed to receive the cloth therebetween, and having projections on the outer ends for engaging the cloth and cooperating to retain said cloth secured to the clip.



2,109,255

DISPLAY FIXTURE

Robert L. Mapson, Los Angeles, Calif., assignor to M. & D. Display Mfg. Corporation, Los Angeles, Calif., a corporation of California

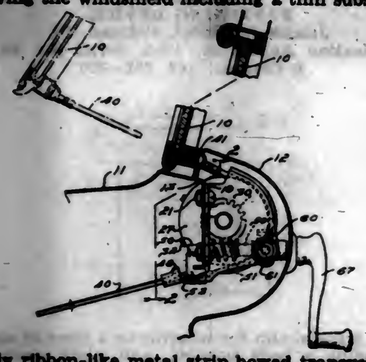
Application July 27, 1935, Serial No. 33,445

3 Claims. (Cl. 211—128)

1. In a display fixture, the combination of: a pair of supporting members cut on their upper edges to form steps of progressively higher levels, each of said members comprising a pair of spaced sheets of metal, one of said sheets having tab portions for engaging and retaining the adjacent sheet in said spaced relation; and a tray extending between said supporting members at each of said steps, each of said trays having downward bent flanges at opposite ends thereof, said flanges being received and supported between the spaced sheets of said supporting members.

2,109,256

WINDSHIELD OPERATING DEVICE



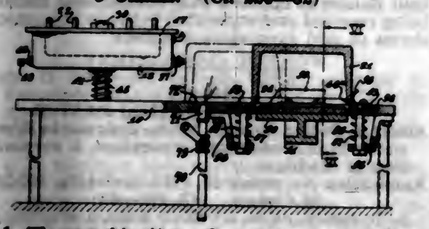
Albert T. Potter, Detroit, Mich., assignor to Ainsworth Manufacturing Corporation, a corporation of Michigan

Application November 10, 1933, Serial No. 697,881

34 Claims. (Cl. 296—34)

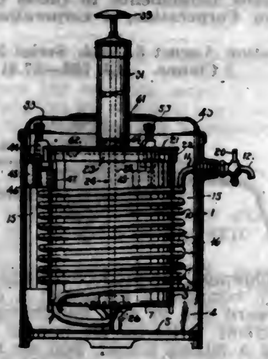
1. In combination, a vehicle body, a windshield or the like hinged to the body, and means for

moving the windshield including a thin substan-



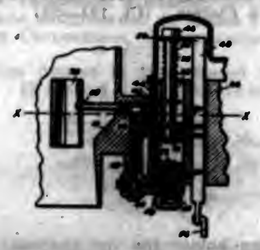
tially ribbon-like metal strip bowed transversely of its length.

2,109,257
WINDSHIELD OPERATING DEVICE
Albert T. Potter, Detroit, Mich., assignor to Ainsworth Manufacturing Corporation, a corporation of Michigan
Application November 26, 1934, Serial No. 754,742
9 Claims. (Cl. 296—84)



6. In combination, a windshield or the like, a pair of flexible tapes possessing sufficient linear rigidity to thrust the shield open, means connecting the tapes at one end and to the windshield, the other ends of the tape being free so as to allow them to longitudinally slide one on the other, rotary means having driving connection with one tape for moving the tapes longitudinally, and means for causing portions of the tapes to travel linearly in a curved path.

2,109,258
SEALING APPARATUS
Gaines Slayter, Newark, Ohio, assignor to Owens-Illinois Glass Company, a corporation of Ohio
Application March 30, 1933, Serial No. 663,667
Renewed November 9, 1936
5 Claims. (Cl. 226—82)



1. The combination of a table, a stationary support for a cover plate or lid, a platform surrounding said support, and springs holding the platform at about the level of the table and permitting downward movement of the platform under pressure, the platform being adapted to hold a hollow article, open side downward, over a cover plate on said stationary support and permitting said article and platform to be moved downward under pressure into sealing engagement with the cover plate.

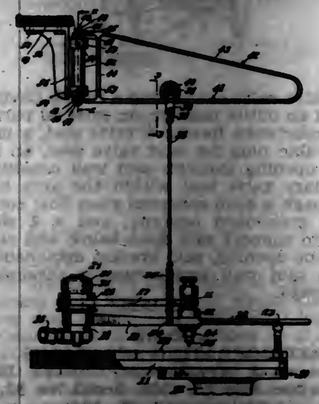
2,109,259
PORTABLE DISPENSING APPARATUS
Charles R. Yirava, Cleveland, Ohio
Application April 6, 1937, Serial No. 135,230
17 Claims. (Cl. 225—1)

1. An apparatus for dispensing liquid from sealed cans comprising inner and outer spaced receptacles, said inner receptacle adapted to snugly hold the can, means for puncturing the top and bottom walls of said can, outlet means for the liquid in the can communicating with said can holder, and means for placing the liquid in said can under air pressure to force said liquid into and through said outlet means.

2,109,260
CARBURETOR
Milton E. Chandler and Emil O. Wirth, South Bend, Ind., assignors to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application December 1, 1933, Serial No. 700,537
5 Claims. (Cl. 261—34)

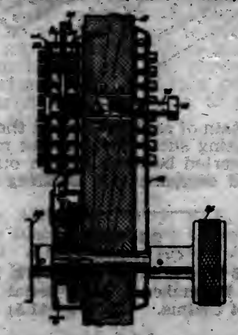
1. In a carburetor, an acceleration pump comprising a cylinder, a piston therein, a piston rod connected to said piston, an actuating member slidable on said piston rod, and a plurality of springs of different resiliency connected in series between the actuating member and piston.

2,109,261
METHOD OF MORDANTING AND UNION DYEING
Edward S. Chapin, Boston, Mass.
No Drawing. Application January 31, 1936, Serial No. 61,753
10 Claims. (Cl. 8—5)



1. A process for the dyeing of union materials composed of animal and vegetable fibers in order to render the dyeings fast to water which comprises treating the materials with a mordant comprising a water soluble chromic salt, and then dyeing the materials with union dyes.

2,109,262
COMBUSTION CHAMBER
Raymond J. Dufour, Oak Park, Ill., assignor to Autogas Corporation, Chicago, Ill., a corporation of Delaware
Application June 1, 1936, Serial No. 82,798
1 Claim. (Cl. 158—1)

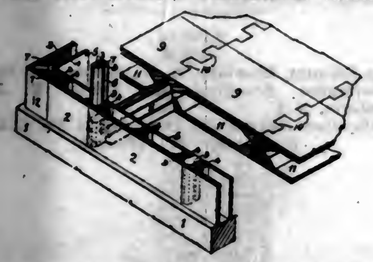


A combustion chamber comprising a stack formed of a series of superimposed segments arranged in layers with the adjacent ends of the segments overlapping and interconnected by ball-and-socket joints, each of said segments having a convex semi-spherical projection and a concave cavity at each end in vertical alinement, said projections and cavities interfitting to form said ball and socket joints, and said segments being arranged so that there are intervening slots between the ends of the superimposed segments for the escape of gases of combustion from the interior of said chamber.

2,109,263
HEAD SUPPORT FOR ROUTING MACHINES
Alphonso R. Eckersall, Chicago, Ill.
Application September 16, 1936, Serial No. 101,024
6 Claims. (Cl. 90—15)

1. The combination with a routing machine for printing plates and the like, having a universally adjustable router head, of supporting means for said head on said machine, and supplementary supporting means for said head independent of said machine, said supplementary supporting means including a trolley and a self-adjusting track for said trolley.

2,109,264
LOCK
Filip Elbaum, Brooklyn, N. Y., assignor to Julius November, Brooklyn, and Arthur B. Just, Astoria, N. Y.
Application August 18, 1937, Serial No. 159,653
12 Claims. (Cl. 70—298)



1. In a device of the class described, the combination of a plurality of paired abutting surfaces spaced a pre-determined distance apart, a locking bar slidable between the said pairs of abutting surfaces and provided with a plurality of recesses spaced apart the said pre-determined distance and connected by central, longitudinal slots, a plurality of pins provided with a pair of lugs normal to each other and axially adjustable from an initial position in which one lug is received in a central longitudinal slot and the other lug is clear of the bar, to a projected position in which the first said lug is clear of the bar and the second said lug is received at the forward end of a recess, the said lugs being somewhat wider than the space separating pairs of abutting surfaces, a plurality of keys for axially adjusting certain of the pins to projected position, a latch means for holding the pins of depressed keys in projected positions, and a manipulative means for moving the bar to locking position, and for rotating the projected pins to turn the first said lugs to a position normal to the central, longitudinal lugs and the second said lugs, in alignment therewith, the said bar movement presenting the forward end of the succeeding recesses to the first said lugs, and the said manipulative means being connected to the said latch means to return the projected pins to initial position, the first said lugs of the projected pins entering the forward ends of the said succeeding recesses whereby return movement of the bar is prevented by the abutment of the said lugs with the said abutting surfaces.

2,109,265
INORGANIC BUILDING SYSTEM
Mortimer Foster, Bronxville, N. Y.
Application August 20, 1935, Serial No. 36,980
4 Claims. (Cl. 72—1)

1. A building frame comprising molded units or elements of mineral material, embedded metal reinforcements therein, said units being of various sizes, dimensions and shapes, portions thereon and at different parts thereof shaped to interlock with complemental portions of other similar

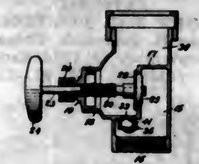
and dissimilar units, said portions being brought together and united by said complemental portions without other fastening means to form the building construction, a cementitious substance

between certain of said portions at their abutting surfaces uniting such surfaces and metallic key members inserted between certain other of said portions and engaging said abutting surfaces.

2,109,266
CONDENSER
Albert W. Franklin, New York, N. Y.
Application December 3, 1936, Serial No. 113,961
4 Claims. (Cl. 175—41.5)

1. A condenser as described comprising a fixed metal electrode having an aperture therein and forming the main body of the condenser, an insulating plate resting thereon, a movable metal electrode of substantially the same shape as said aperture but smaller, said movable electrode having projections to overlap the fixed electrode, and means for clamping the parts together, said means comprising a rivet connected to the movable electrode and insulated from the fixed electrode by means of which the movable electrode may be moved.

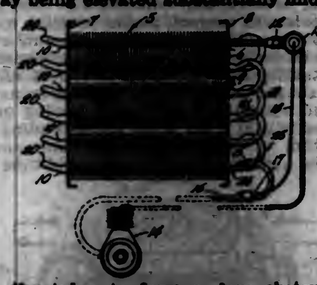
2,109,267
COMBINED CRIB AND WARDROBE
Mary Gresser, Chicago, Ill.
Application February 25, 1937, Serial No. 127,556
4 Claims. (Cl. 5—2)



1. In combination with a crib of the type having a vertically slidable side, a wardrobe including a front wall, means in said crib for supporting said wardrobe and upon which the latter is adapted for sliding movement for opening or closing the same with relation to the crib, a panel in parallel relation with said wall, and connecting means between said wardrobe and said panel, said wall and said panel providing a pocket within which said sliding side when lowered is adapted to fit when said wardrobe remains in a closed position relative to the crib.

2,109,268
KEY-IDENTIFYING DEVICE
Charles F. l'Anson, Kenosha, Wis.
Application May 6, 1936, Serial No. 78,232
2 Claims. (Cl. 40—10)

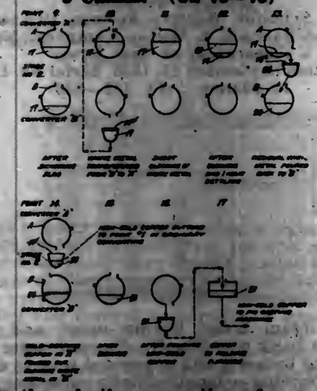
1. A key-identifying device for association with the handle of a pin tumble lock key comprising an open frame of a smaller size than the handle of the key including a front plate and a rearwardly directed flange, an identification card fitted in the frame against the front plate and confined by said flange, bendable tongues on the flange for engaging the rear face of the card, a centrally disposed bendable tongue formed on the upper edge of the frame for engaging in the keyring opening of a key handle, and oppositely extending bendable tongues formed on the lower side of the frame adjacent to the opposite ends thereof for engaging about the lower edges of a key handle.



2,109,269
FLOODLESS RADIATOR STEAM VALVE
Julius B. Kehat, Brooklyn, N. Y.
Application October 17, 1936, Serial No. 106,111
1 Claim. (Cl. 277—54)

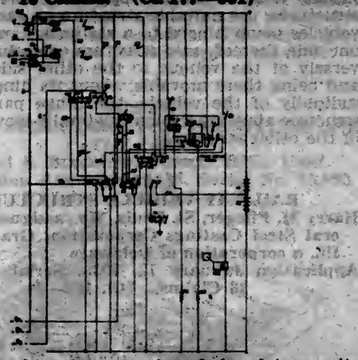
A radiator valve comprising a casing having an inlet and an outlet passage, an integral partition wall therebetween having a valve seat, a manually operable plug for said valve seat, an independent opening through said wall constituting an auxiliary valve seat within the area of the inlet passage, a solid spherical glass float controlling the mentioned opening, and a Z shaped bracket to support said float below and contiguous to the opening, said bracket detachably secured to said wall and accessible through the inlet passage.

2,109,270
REFRIGERATING APPARATUS
Hermann J. Krackowizer, Chicago, Ill.
Application July 25, 1936, Serial No. 92,515
4 Claims. (Cl. 62—126)



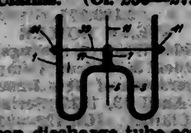
1. A cooling unit having a pair of horizontal, laterally spaced tubes at the same elevation, and a return bend connecting corresponding ends of the tubes and having a passageway therethrough from one tube to the other, said passageway being elevated substantially midway between the tubes to form a dam obstructive to flow of liquid from either tube to the other.

2,109,271
VITREOUS ENAMELED PRODUCTS
Daniel E. Krause, Columbus, Ohio, assignor, by mesne assignments, to Monsanto Chemical Company, a corporation of Delaware
No Drawing. Application October 5, 1936, Serial No. 104,863
10 Claims. (Cl. 91—73)



1. A vitreous enameled article comprising a layer of vitreous enamel vitrified upon the surface of a steel sheet said steel containing from 0.1 to 1.0% of phosphorus, the balance being iron containing the usual impurities ordinarily occurring in enameling steel.

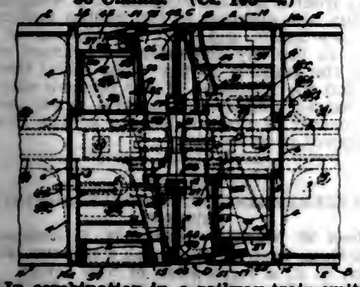
2,109,272
SELECTIVE CONVERTING OF COPPER MATTE
Leonard Larsen and John C. Kinnear, McGill, Nev., assignors to Kennecott Copper Corporation, New York, N. Y., a corporation of New York
Application May 21, 1935, Serial No. 22,572
5 Claims. (Cl. 75—75)



1. In the selective converting of copper matte containing gold, the method which consists in blowing such matte to white metal, subjecting the white metal to a partial blow so short as to convert only a comparatively small percentage of the copper originally in the matte into particles of metallic copper disseminated throughout the mass of white metal, and holding the charge quiet over so long a period as to permit a long settling out of the fraction of copper converted, the particles of copper disseminated throughout the mass during the short blow and long settling period providing a large gold-collecting surface in contact with the matte so that the fraction settled out has a comparatively high gold content, said method being practiced with two converters A and B, by the partial blowing and long settling of the double charge of white metal in A and the collection of a small fraction of high gold copper therein, the pouring of the remaining white metal into B and the blowing of it therein to copper of comparatively low gold content, the removal of such low gold copper from B and the refilling of B with matte and flux, the addition to the molten bottom in A of new matte and flux, the blowing of the charge in the two converters to produce white metal, the transfer of the white metal from B to A and the repetition of the previous steps so as to extract additional gold in a single bottom in converter A until a bottom of the desired enrichment is obtained.

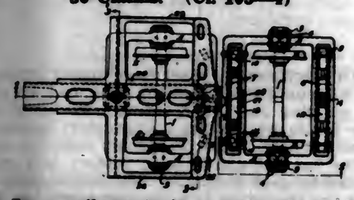
2,109,273
NONINTERFERING SUCCESSIVE SIGNALING SYSTEM
Manfred W. Mushter, Nutley, N. J., assignor to American District Telegraph Company, Jersey City, N. J., a corporation of New Jersey
Application December 21, 1934, Serial No. 758,582
16 Claims. (Cl. 177—361)

1. In combination, a series of signal transmitters; an energized operating line and an energized starting line; each transmitter including a motor for operating the transmitter; means for connecting each motor in circuit with the starting line for energizing such motor; and means operated by each motor for connecting such motor to the operating line for operating the associated transmitter and isolating the starting line and the portion of the operating line on one side of the associated transmitter.



2,109,274
TUBE STRUCTURE
Hans Nicolaesen, Berlin, Germany, assignor to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands
Application November 19, 1935, Serial No. 50,487
In Germany November 12, 1934
4 Claims. (Cl. 250—27.5)

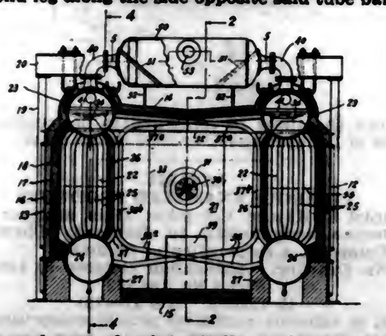
1. An electron discharge tube comprising electrodes, an envelope, a press, an anchoring mem-



ber passing through said press transversely to the major axis thereof, and means fastening said anchoring member to the walls of said envelope.

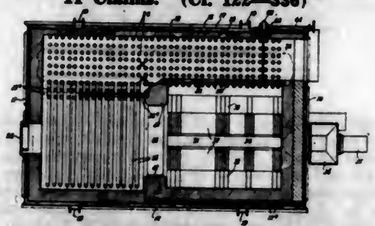
2,109,275
RAILWAY CAR STRUCTURE
Harry M. Pflager, St. Louis, Mo., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware
Application December 22, 1933, Serial No. 703,806
58 Claims. (Cl. 105—2)

1. In combination in a railway train unit, adjacent vehicles having opposing movable end structures, the movable structure on each of said vehicles being hinged to a stationary member at one side thereof, said structure extending transversely of the vehicle to the other side thereof and being there movable, about its hinge, longitudinally of the vehicle, the hinge part of one structure abutting the longitudinally movable part of the other structure.



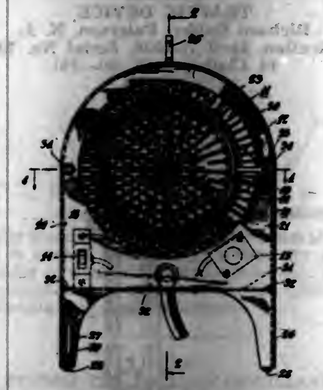
2,109,276
RAILWAY VEHICLE STRUCTURE
Harry M. Pflager, St. Louis, Mo., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware
Application January 12, 1935, Serial No. 1,481
36 Claims. (Cl. 105—4)

26. In a railway train, a pair of car bodies coupled together at their adjacent ends, individual two-wheel trucks under the adjacent end portions of said bodies, said trucks including structure arranged to provide for lateral motion of the wheels and axles relative to said bodies and being coupled direct to each other so that the wheels extend in a line substantially tangent to the track when rounding curves, said lateral motion structure having means cushioning the lateral forces between the wheel flanges and the body.



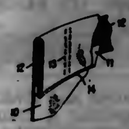
2,109,277
STEAM BOILER
Karl C. Schmidt, Western Springs, Ill., assignor to The Babcock & Wilcox Company, Newark, N. J., a corporation of New Jersey
Application April 13, 1935, Serial No. 16,115
20 Claims. (Cl. 122—235)

1. A steam boiler having a pair of substantially parallel horizontally disposed upper and lower drums, a bank of vertically disposed water tubes extending between and connected to said drums along the length thereof, means forming a longitudinally extending combustion lane and a heating lane laterally adjoining said combustion lane and containing said tube bank, a row of substantially L-shaped water tubes extending transversely of said combustion lane each having one leg connected to said lower drum and extending along the bottom of said combustion lane and the second leg along the side opposite said tube bank,



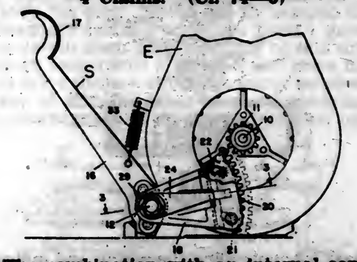
a second row of substantially L-shaped water tubes extending transversely of said combustion lane each having one leg connected to said lower drum and extending along said tube bank and the second leg extending across the top side thereof, a longitudinally extending drum connected to the upper ends of both of said rows of L-shaped tubes, and means for burning fuel in said combustion lane and generating heating gases flowing longitudinally thereof and thence through said heating lane.

2,109,278
STEAM BOILER
Karl C. Schmidt, Western Springs, Ill., assignor to The Babcock & Wilcox Company, Newark, N. J., a corporation of New Jersey
Application September 25, 1936, Serial No. 102,492
11 Claims. (Cl. 122—336)



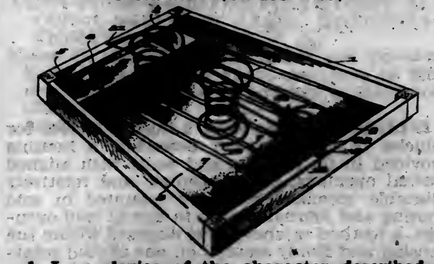
1. A steam boiler having upper and lower drums, a bank of vertically disposed water tubes extending between and connected to said drums, means forming a longitudinally extending combustion lane and a heating lane laterally adjoining said combustion lane and containing said tube bank and communicating with said combustion lane at one end thereof, a stoker at the opposite end of said combustion lane for burning solid fuel thereon and generating heating gases flowing longitudinally through said combustion lane and thence through said heating lane, and a dividing wall structure including transversely spaced refractory winged walls arranged to provide a restricted outlet for the heating gases to the remaining portion of said combustion lane.

2,109,279
ELECTRIC HEATER
Harvey A. Soverhill, Chicago, Ill., assignor to The American Foundry Equipment Company, Mishawaka, Ind., a corporation of Delaware
Application July 6, 1935, Serial No. 30,987
9 Claims. (Cl. 219—39)



7. In an electric air heater, an annular grid comprising an annular jacket, electric heat generating elements within said jacket, said jacket being cast around said electric heat generating elements, outer heat dissipating flanges extending outwardly from said jacket, inner heat dissipating flanges extending inwardly from said jacket and utilizing substantially the entire heat dissipating space within said jacket, and a fan adjacent said grid for directing a stream of air over said grid.

2,109,280
GARMENT SUPPORT
Siegfried Rasch, Essen, Germany
Application December 6, 1935, Serial No. 53,133
2 Claims. (Cl. 2—237)

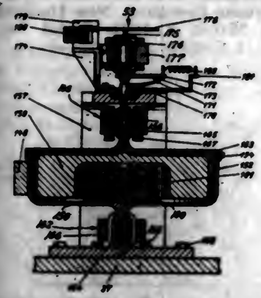


1. In a lower garment having a waistband, a continuous hem formed in a piece of material adjacent the upper edge thereof, a relatively wide flat strip of elastic material extending along the major portion of the hem but terminating short of either end thereof, a plurality of spaced rows of stitching, two of which are adjacent the end of the elastic band, extending transversely of the band and securing the same to the garment adjacent the hem, with a narrow portion of the hem lying outside the band, the attachment between said garment material and elastic strip being such that the elastic strip is stretched to a fraction of its elasticity when the garment material is stretched out to its limit and said band and hem being folded over and stitched to the garment by a row of stitching along the length of the hem but not extending through the band, said band of elastic material lying inside a pocket thus formed and being free of stitching to the outside of the pocket, and means to button one end of the hem to the other.

2,109,281
ENGINE STARTER
Alfred S. Besma, New Holstein, Wis., assignor to The Lauson Company, New Holstein, Wis.
Application March 6, 1937, Serial No. 129,401
4 Claims. (Cl. 74—6)

1. The combination with an internal combustion engine including a crank-shaft and a starter pinion thereon, of a starting device for the engine including an oscillating starting arm, means for operating the arm, a sector gear slidably mounted on said arm for free radial movement toward and away from the pinion having angularly extending slots therein, stationary pins carried by the arm mounted in said slots for engaging the angular walls thereof, and means for initially retarding movement of the sector gear with the arm, as and for the purpose specified.

2,109,282
SPRING STRUCTURE FOR FURNITURE AND THE LIKE
Samuel S. Bernstein, Beverly Hills, Calif.
Application August 13, 1936, Serial No. 95,893
5 Claims. (Cl. 155—179)

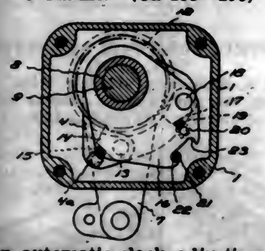


1. In a device of the character described, a frame, a coil spring supporting fabric secured to said frame, said fabric being provided with ribs, a coil spring on said supporting fabric, a coil of said spring passing through the material of one or more of said ribs to secure the same to the fabric.

2,109,283
INSTRUMENT FOR INDICATING NAVIGATIONAL FACTORS
Johann Maria Boykow, Berlin-Lichterfelde-West, Germany, assignor, by mesne assignments, to Deutsche Luftfahrt- und Handels-Aktien-Gesellschaft, Berlin, Germany, a corporation of Germany
Application January 10, 1934, Serial No. 705,997
21 Claims. (Cl. 72—151)

4. An instrument for indicating navigational factors, comprising an integrator including a swinging mass oscillatable about a vertical axis, a reversible electric motor with a field and an armature, the field being rigidly connected with

the swinging mass, and the armature being freely rotatable coaxially with the swinging mass, and a contact mechanism connected with the swing-



ing mass for controlling the motor, and indicating means actuated in accordance with the motor revolutions.

2,109,284

SLACK ADJUSTER FOR MOTOR VEHICLE BRAKES

Erik Johan Mårten Brinck, Selvesborg, and Rune Viktor Augustus Olsson, Kyrkhult, Sweden

Application October 22, 1936, Serial No. 107,080
In Sweden October 24, 1935
8 Claims. (Cl. 188—196)

1. In an automatic slack adjusting device for vehicles of the character described, a housing provided in its opposite end walls with aligned journal openings, two concentric and relatively rotatable members rotatably mounted in said housing and journaled each in one of said openings, a toothed ratchet wheel disposed within the housing and firmly secured on one of said rotatable members, a pawl carried within the housing on the other of said rotatable members and adapted to cooperate with the said ratchet wheel, and a second pawl disposed within the housing and also adapted to cooperate with the said ratchet wheel and movable within predetermined limits together with the ratchet wheel, the teeth of the ratchet wheel being inclined in the direction opposite to the direction in which the ratchet wheel is intended to be rotated at brake application movement.

2,109,285

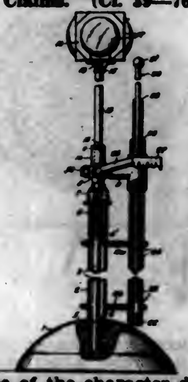
ALLOY

Marshall H. Brown, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application March 26, 1937, Serial No. 133,267

2 Claims. (Cl. 75—171)

1. Alloys resistant to corrosive agents which consist of from 28 to 40% of molybdenum, small but effective amounts of iron up to 5%, of copper up to 5%, of tungsten up to 10%, chromium and manganese each in small but effective amounts and totalling up to 0.25%, carbon up to 0.05%, silicon up to 0.10%, and the balance of the alloy being nickel.



2,109,286

TRAFFIC DEVICE

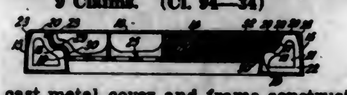
Richard Cubby, Paterson, N. J.

Application April 7, 1936, Serial No. 73,140

12 Claims. (Cl. 39—76)

3. In a device of the character described, the combination of a support having a bracket projecting therefrom, a guard pole carried by said support and movable vertically and longitudinally into and out of said bracket, said guard pole when free from said bracket being also movable into two horizontal positions, one across the path of the pedestrian and the other at right angles to said path.

2,109,287



MANHOLE COVER AND FRAME

Vivian Elkington, Dover, England

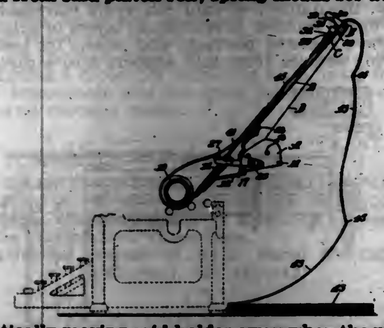
Application November 1, 1935, Serial No. 47,857

In Great Britain November 9, 1934

9 Claims. (Cl. 94—34)

1. A cast metal cover and frame construction for manholes, comprising a frame of inverted substantially U-shaped channel section adapted to be filled with concrete or the like, said section being also provided with openings at the top whereby the section may be filled either from the bottom or the top, the inner side wall of the channel being formed with a cover-seating surface extending continuously around the frame and from the top to the bottom, said surface being inclined over at least a part of its depth, and a cover having a seat conforming for close face to face contact from top to bottom with said cover-seating surface.

2,109,288



TYPEWRITER ATTACHMENT

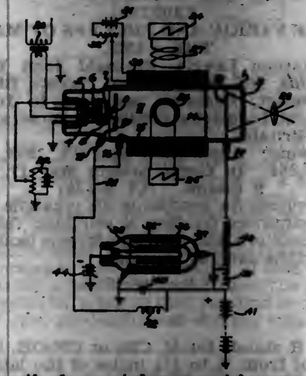
John E. Euth, Chicago, Ill., assignor to United Autographic Register Co., a corporation of Illinois

Application January 6, 1936, Serial No. 57,831

10 Claims. (Cl. 197—126)

1. In a typewriter having a carriage with a platen roll around which stationery strips interleaved with transfer-slips may be led: a frame mounted on said carriage; a transfer-slip holder slidably mounted on said frame for movement to and from said platen roll; spring means for auto-

matically moving said holder away when the platen roll is turned rearwardly; means for locking said holder in a position remote from said platen; and manual means adjacent to said platen roll for releasing said locking means.



2,109,289

HIGH POWER PROJECTION OSCILLOGRAPH

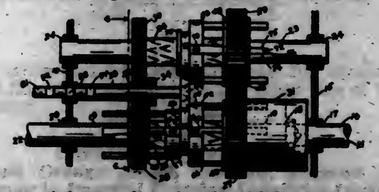
Philo T. Farnsworth, San Francisco, and Frank J. Selmers, San Jose, Calif., assignors to Farnsworth Television Incorporated, San Francisco, Calif., a corporation of California

Application November 2, 1936, Serial No. 108,723

3 Claims. (Cl. 178—7.7)

1. A cathode ray tube comprising an envelope containing a source of electrons, a collecting electrode normally distortable by the electrostatic stresses set up when energized to a predetermined steady collection potential, an oscillator connected to said electrode, and circuits maintaining the frequency of said oscillator substantially higher than the natural period of said collecting electrode.

2,109,290



TRANSMISSION

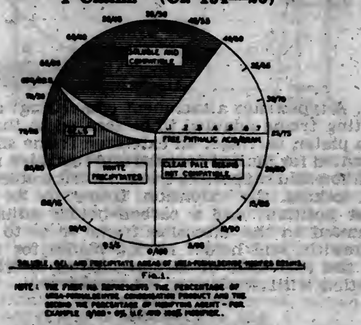
Charles Heckmann, West Palm Beach, Fla.

Application February 20, 1936, Serial No. 64,974

6 Claims. (Cl. 74—377)

1. In a transmission, the combination of a drive shaft, a driven shaft co-axial with said drive shaft, a countershaft parallel thereto, a housing member fixedly secured to the drive shaft, drive means fixedly mounted on said housing member, drive means rotatably mounted on the driven shaft, driving means on the countershaft, one of said driving means fixedly secured to said countershaft, the other of said driving means rotatable on said countershaft, a pinion means in mesh with the drive means on the driven shaft and with the drive means fixedly secured to the countershaft, housing members fixedly mounted on the driven shaft and internally of said driving means on said driven shaft and said drive means on the drive shaft, a further housing member internally of said rotatably mounted countershaft drive means, expansible means mounted on the

outer periphery of each of said housing members, a plurality of operating means carried by each of said housing members and adapted for engagement with said expansible means, each of said drive means being freely rotatable when its respective expansible means is in contracted position and operatively connected with its associated shafts when said expansible means is in expanded position, means slidably mounted on said driven and countershafts having means for engaging and disengaging the said plurality of operating means, means connecting said slidable means for synchronously shifting said slidable means.



2,109,291

UREA-FORMALDEHYDE-POLYHYDRIC ALCOHOL-POLYBASIC ACID CONDENSATION PRODUCTS

Almon G. Hovey, Pleasant Ridge, and Theodore S. Hedgins, Detroit, Mich., assignors to Helmuth Reichhold, doing business as Reichhold Chemicals, Detroit, Mich.

Application June 10, 1937, Serial No. 147,568

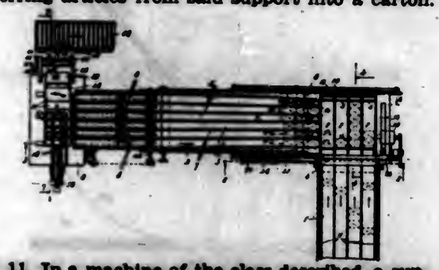
1 Claim. (Cl. 134—26)

A coating composition comprising the product of reaction of a urea-formaldehyde condensation product and an unmodified polyhydric alcohol-phthalic anhydride modifier, said reaction product consisting of a quantity of modifier within the range of 32.5%–60.0% and a quantity of urea-formaldehyde condensation product falling within the range of 40.0%–67.5%, an excess of polyhydric alcohol of 100% over the theoretical proportion being employed in the modifier, and the

molecular ratio of formaldehyde to urea being at least 2–1, the reaction being carried out in the presence of butanol.

2,109,292
GRINDING DEVICE
Joseph Hribar, Lockport, Ill.
Application July 20, 1936, Serial No. 91,611
14 Claims. (Cl. 51—241)

1. A grinding implement of the character set forth, comprising an elongated frame equipped at its upper end with a crank-shaft bearing; a flexible endless belt of abrasive material mounted on a roller journalled in said frame; means for driving said belt; and means for adjusting said belt towards and away from the crank-shaft.



2,109,293
ADAPTER FOR TYPEWRITERS
Louis Jensen, Chicago, Ill., assignor to United Autographic Register Co., a corporation of Illinois
Application October 14, 1937, Serial No. 169,017
6 Claims. (Cl. 197—126)

1. A typewriter attachment comprising: a supporting frame adapted to be secured to the rear of a platen carriage; an extension frame slidably mounted for limited forward and rearward movement on said supporting frame; a releasable catch for locking the extension frame in its rearmost position; and a carbon-holder adjustably mounted on the extension frame so as to move therewith, said holder having blades for securing the rear ends of carbon slips in interleaved relation with stationery led thereover.

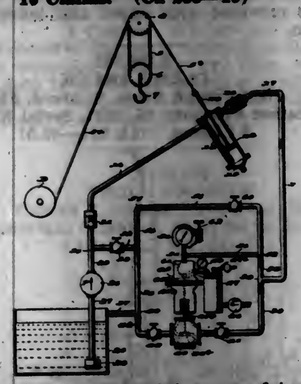
2,109,294
CASE PACKING MACHINE
Wallace D. Kimball, Jackson Heights, and Cornelius I. Braren, Jamaica, N. Y., assignors to Standard-Knapp Corporation, Long Island City, N. Y., a corporation of New York
Application February 7, 1934, Serial No. 710,664
Renewed January 5, 1937
19 Claims. (Cl. 226—14)

1. In a machine for packaging articles, a support on which the articles are assembled, a plurality of conveyors for feeding the articles to said support, said conveyors being arranged to deliver the articles to the support at points displaced from each other both vertically and horizontally, the number of said conveyors corresponding to the number of horizontal layers of articles in the completed package, and means for transferring articles from said support into a carton.

11. In a machine of the class described, a support for receiving articles to be packed in a carton, means for assembling articles on said support in position to be placed in the carton, means for discharging said articles into the carton, and means for holding a carton in filling position adjacent said support including a rock-arm adapted to engage the carton to hold it horizontally at the filling position and aid in lowering and turning the carton from horizontal filling position to upright position, and means actuated by said arm to stop the operation of said article-discharging means when the carton is moved away from filling position.

2,109,295
TEXTILE FABRIC AND PROCESS OF MAKING THE SAME
Leslie Gordon Lawrie, Reginald John William Reynolds, and Henry Alfred Piggott, Blackley, Manchester, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application May 13, 1935, Serial No. 21,294. In Great Britain May 17, 1934
9 Claims. (Cl. 8—30)

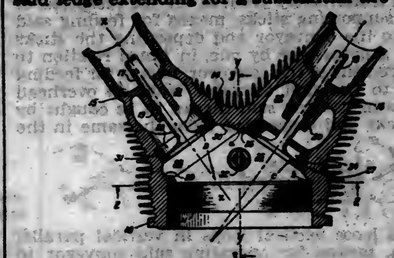
1. A process for producing an organdie fabric, which comprises treating a cellulosic fabric in the presence of alkali with an alkylene oxide compound of the general formula



wherein R stands for H, CH_3 or CH_2OH, in proportion of from ½ to 1½ moles of the latter per unit of $C_6H_{10}O_5$ in the fabric, and under conditions equivalent to about room temperature and a time from about 17 to about 20 hours.

2,109,296
FUEL CONTROL APPARATUS
William E. Leibing, Sausalito, Calif., and William B. Fageol, Kent, Ohio
Application October 14, 1931, Serial No. 568,944
9 Claims. (Cl. 123—97)

1. In combination with the carburetor and throttle of an internal combustion engine; a fuel supply cut-off valve adapted for installation adjacent to and on the engine side of said throttle valve; and completely automatic means operative only when the throttle is in idling position and the pressures on the engine side of the throttle drop below the pressures normally present when the engine is idling to actuate said valve to cut off the fuel supply to the engine, said means including a device for admitting air directly from the atmosphere into the space between said cut-off and throttle valves.

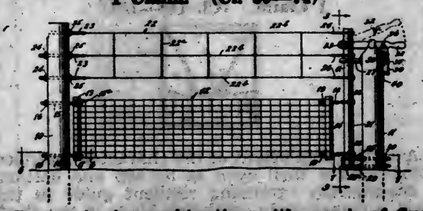


2,109,297
HYDRAULIC CONTROL FOR DRILLING RIGS
William F. McMurry and George F. Phillips, Tulsa, Okla., assignors to Scientific Engineering Corporation, Tulsa, Okla.
Application August 14, 1935, Serial No. 36,187
10 Claims. (Cl. 255—19)

1. Apparatus for maintaining a predetermined drilling weight on a string of drilling tools, including means controlled by variations in said predetermined weight to compensate for said variations, said means comprising a fixed hydraulic cylinder, a piston and piston rod in said cylinder, means for securing the dead end of a tool supporting cable to said piston rod, a pump for continuously delivering fluid to said cylinder under a constant pressure, separate means for continuously discharging fluid from said cylinder, and means responsive to the pressure in said cylinder for controlling said discharge means, the pressure in said cylinder being in turn responsive to variations of said predetermined drilling weight.

2,109,298
INTERNAL COMBUSTION ENGINE
Frank C. Mock, Montclair, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey
Application December 16, 1935, Serial No. 53,822
9 Claims. (Cl. 123—191)

1. In an internal combustion engine, a cylinder, a cylinder head therefor, having a combustion space therein and an intake port in one side thereof, a valve for said port having its axis inclined to the axis of said cylinder, said cylinder head having its combustion space defined by two intersecting curved surfaces, one of which is a surface of revolution coaxial with said valve and has a center of curvature between the cylinder axis and the valve, and has a curvature radius greater than the distance between the center of curvature and the cylinder wall adjacent the valve, a ledge beneath the lower edge of said valve having a surface extending radially of the cylinder and merging with the surface of revolution, said ledge extending for a substantial arc around

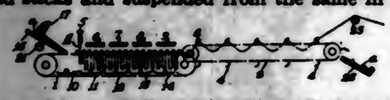


the inner periphery of said head for directing fluid flow from said port to the other side of the cylinder.

2,109,299
CHEMICAL COMPOSITION
Joseph Grange Moore, Runcorn, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application April 6, 1936, Serial No. 73,042. In Great Britain April 25, 1935
5 Claims. (Cl. 260—1)

4. The process for the preparation of rubber hydrochloride which comprises treating with hydrogen chloride a solution of raw rubber in a solvent, the solvent being present in an amount sufficient to dissolve all the rubber but insufficient to dissolve all the rubber hydrochloride formed, and continuing the treatment with hydrogen chloride until there is a separation of the reacting mass into a liquid phase consisting of the solvent which yields no further solid on treatment with methanol, and a gel of rubber hydrochloride.

2,109,300
GATE
Martin Mortensen, Verdi, Nev.
Application March 11, 1936, Serial No. 68,331
1 Claim. (Cl. 29—74)



In a gate, in combination with a pair of fixed gate posts, a flexible gate connected to one of the posts and adapted to be locked to the other post; a lever secured to the gate at its free end in such a way that the lever may be swung to tighten or loosen the gate, said lever being directly engageable with the other gate post to hold the gate in tension; said other gate post having a slot in its top providing a keeper for the lever, which is swung vertically down into the slot.

2,109,301
APPARATUS FOR AFTER-TREATMENT OF FRESH MADE RAYON THREAD
Kazuji Nakano, Nada-ku, Kobe, Japan
Application February 25, 1935, Serial No. 8,176
In Japan March 2, 1934
1 Claim. (Cl. 8—16)

A machine for the after-treatment of rayon threads, comprising in combination, the following

elements, to wit: an endless conveyor composed of a pair of chains in parallel relation, composed of links transversely grooved for the reception of thread supporting sticks, means for feeding said sticks to the conveyor and depositing the sticks in said grooves, one by one, in timed relation to the movement of the conveyor, means for feeding thread to the said conveyor from an overhead source and causing said thread to be caught by said sticks and suspended from the same in the

form of loose vertical loops in vertical parallel relation, means for operating said conveyor to cause the loops to be carried back from the point of first formation, a second conveyor similar to the first and geared to the latter so as to travel at a faster rate than the latter, and means for transferring the sticks and suspended loops to the second conveyor and causing said loops to be shortened and spaced apart a greater distance than by the first conveyor.

2,109,202
CARBON ELECTRODE
Eberhard Neukirch, Bitterfeld, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application October 31, 1933, Serial No. 696,113. In Germany November 5, 1932
4 Claims. (Cl. 176—123)

3. An unbaked carbon electrode comprising powdered coke and a bonding medium, the latter substantially consisting of at least about 90 percent by weight of solid bitumen, the remainder being oil bitumen.

2,109,203
CUTTING IMPLEMENT
Hill Ogletree, Austin, Tex.
Application April 6, 1937, Serial No. 135,323
1 Claim. (Cl. 146—162)

A cutting implement of the character described comprising a shell open at its top and bottom, a downwardly extending resilient guide in the shell, a transversely extending blade in the shell, said blade underlying the lower end of the said guide and having its ends abutting a pair of opposed walls of the shell, and blade clamping brackets struck out from opposite sides of the shell, the upper and lower edges of the struck out portions being bent over the upper and lower edges of the blade for supporting the ends of the blade in the shell.

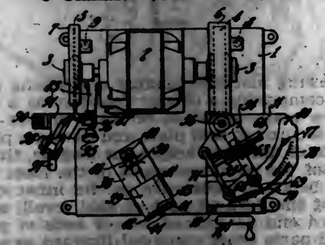
2,109,204
CRANE
Elon A. Ormsby, Centerville, Calif.
Application June 15, 1937, Serial No. 148,292
2 Claims. (Cl. 212—65)

1. In a crane the combination of a platform provided with a socket, a base plate secured upon the platform, a tubular standard extending through the base plate and fitting in the socket at its lower end, braces between the plate and the upper end of the standard, and a rotary mast the lower part of which fits within the standard

and is provided with upper and lower bearings therein.

2,109,205
CLAMP TRUCK
Paul Joseph Stine, Sanford, Fla.
Application February 26, 1937, Serial No. 127,985
3 Claims. (Cl. 214—65.5)

1. The combination with a hand truck having inwardly and outwardly movable gripping bars at the lower end thereof, of means above the bars for moving said bars inwardly and outwardly and adjusting the range of operation thereof, said means comprising operating arms pivotally and floatably mounted on the truck, the lower ends of said arms being pivotally connected to the gripping bars, a rotatable threaded shaft carried by the truck adjacent its upper end and having right and left hand threads, the upper ends of the operating arms being threadably connected to said threaded shaft, said means for adjusting the range of operation being disposed between the bars and threaded shaft.

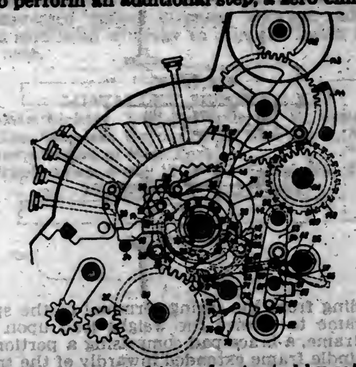


2,109,206
WOOL-LIKE ARTIFICIAL FIBERS AND PROCESS OF MAKING SAME
Arthur von Weinberg, Frankfort-on-the-Main, Hanns Rein, Bad Homburg v. d. H., and Otto Eisenhut, Heidelberg, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application January 5, 1934, Serial No. 705,474. In Germany January 17, 1933
4 Claims. (Cl. 18—54)

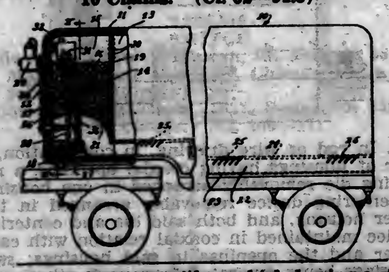
1. Process of manufacturing artificial fibers which comprises dehydrating newly spun wet regenerated cellulose fibers having the dyeing properties of copper silk at room temperature in several successive baths containing liquid alcohol of an increasing concentration, the dehydration being interrupted when the treated fibers still contain the so-called molecular water usually present in commercial brands.

2,109,207
PROCESS OF MAKING WOOL-LIKE ARTIFICIAL FIBERS
Arthur von Weinberg, Frankfort-on-the-Main, Hanns Rein, Bad Homburg v. d. H., and Otto Eisenhut, Heidelberg, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application December 13, 1934, Serial No. 757,572. In Germany December 29, 1933
3 Claims. (Cl. 18—54)

1. Process of making a wool-like artificial fiber which comprises treating wet fiber, which has been spun from viscose having a degree of ripeness below 7 to 6 Hottenroth, with organic liquids miscible with water.



2,109,208
DRILL GRINDER
Carroll E. Adams, Pawtucket, R. I.
Application March 2, 1936, Serial No. 66,836
9 Claims. (Cl. 51—219)

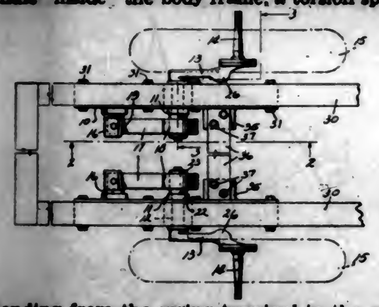


1. In combination, in a drill grinding apparatus, a base, a grinding wheel mounted on the base, means for operating the grinding wheel, a clutch for holding a drill, a bearing sleeve in which said clutch is slidably and rotatably supported, means for moving said clutch longitudinally in said bearing sleeve when said clutch is rotated comprising a radially adjustable stud on said bearing sleeve and a cam on said clutch cooperating with said stud, said cam being provided with a plurality of arcuate cam faces, each of said cam faces having an inner annular edge in a plane perpendicular to the axis of said clutch and an outer annular edge in a plane at an angle to the plane of the inner edge, as described.

2,109,209
CASH REGISTER, ACCOUNTING AND THE LIKE MACHINES
Ernst Breitling, Berlin-Tempelhof, Germany, assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
Application September 5, 1935, Serial No. 39,208
In Germany November 29, 1934
3 Claims. (Cl. 101—93)

1. In a cash register, accounting and the like machine provided with a recording device containing type carriers, a differential device performing a differential movement during a machine operation, said differential device consisting of an actuating and a differential member, a latch for connecting and disconnecting both said members and thereby effecting the differential movement for differentiating said type carriers, a special member in said differential device adapted to perform an additional step, a zero eliminating device connected to and actuated by said differential device, means for interconnecting the zero eliminating device of one denominational order with the one of the next order, said means adapted when arrested by a connecting means of the next order to impart the additional step to the said special member during the said differential movement of the differential device.

2,109,210
WATER ICE AND DRY ICE REFRIGERATION SYSTEM
Almon J. Cordrey, Chicago, Ill., assignor to The Liquid Carbonic Corporation, Chicago, Ill., a corporation of Delaware
Application July 2, 1936, Serial No. 88,716
10 Claims. (Cl. 62—91.5)



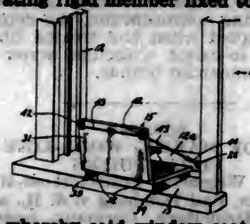
1. In combination with a vehicle having a storage space therein, a bin carried by said vehicle and adapted to hold ice therein, means for circulating air from said storage space through said bin and back to the storage space, a dry ice refrigeration apparatus in said bin and means to bring said apparatus into operation when the air in the storage space is not maintained sufficiently cool by ice in the bin.

2,109,211
TRAILER WHEEL ASSEMBLY
Max E. Dayton, Rockford, Ill., assignor to Bamax Machine Co., Inc., Rockford, Ill., a corporation of Illinois
Application July 1, 1935, Serial No. 29,253
1 Claim. (Cl. 280—106.5)

In a trailer frame and wheel construction a comparatively light body frame, oppositely posi-

tioned individually sprung wheels, spindles for the wheels having a crank-like configuration extending laterally of the trailer frame and having a short, comparatively stiff spindle frame quickly attachable to the body frame to provide a mounting for said spindles, a terminal for the spindle "inside" the body frame, a torsion spring

extending from the spring terminal to the spindle frame to receive the weight load upon the body frame, a brace pad comprising a portion of the spindle frame extended inwardly of the trailer frame and a strut extending between the brace pads whereby to resist torsional strains upon the spindle frame by reason of the external disposition of the spindle cranks.



2,109,312
DIE HOLDER AND GUIDE
Bless C. Dimmick, Peoria, Ill., assignor to Keystone Steel & Wire Company, Peoria, Ill., a corporation of Illinois
Application June 18, 1936, Serial No. 85,852
5 Claims. (Cl. 205—25)

5. In rod or wire drawing, in combination, a pair of housings having coaxial openings, a reducing die removably arranged in one housing, a centering device removably arranged in the other housing, and both said die and centering device maintained in coaxial relation with each other and the openings in said housings; said housings being separated from each other with an open space therebetween, the die being removable axially of its housing and laterally through said space.

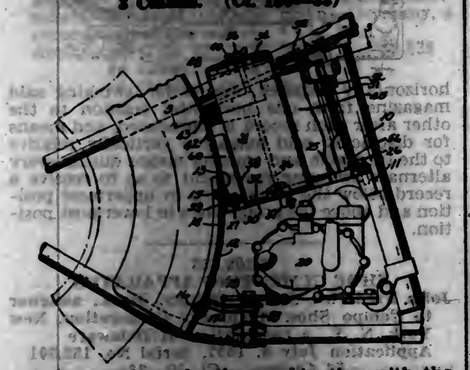
2,109,313
WINDOW SEAT
Harry Green, Bronx, N. Y., assignor of one-half to Adolph Wasserlauf, Jackson Heights, Long Island, N. Y.
Application March 23, 1935, Serial No. 12,355
7 Claims. (Cl. 264—24)

1. In combination, a window seat comprising a bottom member, a back member hinged to the rear edge of the bottom member, a member attached to the underside of said bottom member and having an inclined underedge, and means for attaching said window seat to a window frame comprising a slotted metallic member fixed to said frame and adapted to receive in the slot a cooperating rigid member fixed to said bottom

member whereby said window seat is prevented from lateral movement in a plane parallel to the plane of said bottom member while in operative position.

2,109,314
BINDING AND PIPING ATTACHMENT FOR SEWING MACHINES
Walter C. Greist and Carl G. Bashr, New Haven, Conn., assignors to The Greist Manufacturing Company, a corporation of Connecticut
Application April 9, 1936, Serial No. 73,544
1 Claim. (Cl. 112—137)

A sewing machine binding and piping attachment comprising a presser-foot having a needle-hole, a plate mounted on said presser-foot, a scroll secured to said plate and having a plurality of slots of different heights or lengths, the inner edges of the in-turned parts of the lobes of said scroll being in proximity to the inner concave face of the vertical part of said scroll, and the forward end or ends of one or both of said in-turned parts being extended forward so as to be close up to and substantially in contact with said presser-foot and near the said needle-hole, and means permitting lateral adjustment of said plate and the scroll attached thereto on said presser-foot.



2,109,315
RADIO CARRYING ATTACHMENT FOR BICYCLES AND MOTORCYCLES
William S. Harley, Milwaukee, Wis., assignor to Harley-Davidson Motor Co., Milwaukee, Wis., a corporation of Wisconsin
Application April 30, 1936, Serial No. 77,160
2 Claims. (Cl. 224—32)

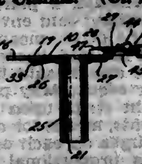
1. A rugged protective and radio carrying attachment for a motorcycle comprising the combination with a motorcycle rear wheel and axle

and connected frame stays, of a set of runner shoes having their rear ends connected with each other and also supported from the axle at the respective sides of the wheel, said runner shoes having rear portions extending laterally and side portions extending forwardly along the sides of the wheel above the axle, with convergent front end portions connected to the frame stays, cage members connected with said shoes, and mountings connected with the cage members and positioned to support radio equipment between the shoes and the wheel.

2,109,316
OIL TANK AND BATTERY ASSEMBLY
William S. Harley, Milwaukee, Wis., assignor to Harley Davidson Motor Company, Milwaukee, Wis., a corporation of Wisconsin
Application May 16, 1936, Serial No. 80,036
3 Claims. (Cl. 180—33)

1. In a motorcycle, the combination with the saddle post tube, upper rear frame fork and mud guard, of a battery supporting shelf intermediately connecting said tube and mud guard in bracing relation thereto and in a position to support a battery with its top portion extending between and above the arms of said frame fork, said shelf having an upwardly projecting battery retaining cross wall secured to the mud guard at each end, and an oil tank extending around the battery with its ends secured to the cross wall to form a battery receiving socket.

2,109,317
WATER FLOW DETECTOR AND ALARM MEANS
Clarence C. Johnson, New York, N. Y., assignor to American District Telegraph Company, Jersey City, N. J., a corporation of New Jersey
Application June 23, 1933, Serial No. 677,262
6 Claims. (Cl. 169—23)

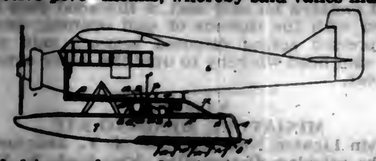


1. In combination, an attachment for the fluid pressure line of a sprinkler system comprising a casing having an attaching portion, said casing having therein a surge passage which extends through said portion for communication with the interior of the line; means forming a by-pass around a part of the passage, said by-pass having therein a seat and there being a threaded opening associated with said seat; removable by-pass constricting means having an apertured head engaged on said seat, a threaded plug engaged with the threads of said opening, and a compressed spring disposed between said plug and said head whereby to urge the latter against its seat.

2,109,318
MINIATURE MENDING KIT
Malvin Lichter, New Rochelle, N. Y., assignor to The Stickless Corporation, New York, N. Y., a corporation of New York
Application June 18, 1935, Serial No. 27,166
13 Claims. (Cl. 206—64)

1. In the manufacture of mending kits, the method which includes simultaneously winding a plurality of differently colored threads at spaced points near one end of a long strip of cardboard or like support to form a first set of threads, intermittently relatively moving the threads and the strip longitudinally of the strip by a substantial amount in order to wind succeeding sets of the threads on said strip, the distance of said movement exceeding the space occupied by the first set of threads, and slitting the strip between each of the sets of threads.

2,109,319
SWITCH
Edward J. Mastney, Berwyn, Ill., assignor to Oak Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application August 18, 1937, Serial No. 159,635
12 Claims. (Cl. 200—11)

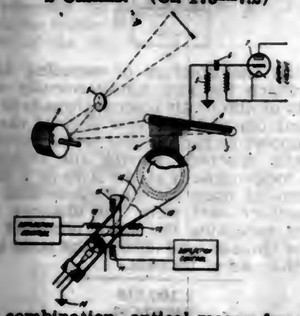


1. A switch comprising a base plate having a shaft portion mounted thereon and carrying a plurality of stator contacts arcuately disposed with respect to said shaft and having an arcuate slot between said contacts and shaft portion, a circular sleeve rotatably disposed around said shaft on the side of the plate remote from said contacts, and a spring rotor carried by said sleeve threaded through said slot and cooperating with said contacts.

2,109,320
HYDROAEROPLANE
Frank C. Scheerbucher, Milwaukee, Wis.
Application March 18, 1935, Serial No. 11,630
7 Claims. (Cl. 244—112)

2. The combination with a pontoon having a series of transversely extending pivot means be-

neath its stern end, of a series of vanes fulcrumed on said means beneath the pontoon, each vane being longer than the spacing of said means in a series and projecting forwardly from its respective pivot means, whereby said vanes may be

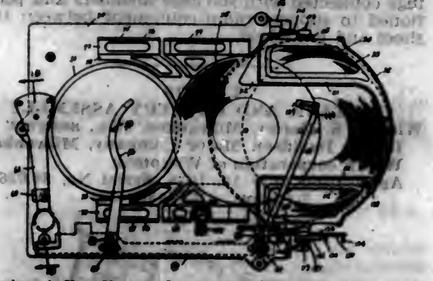


folded to overlap each other with their free ends projecting forwardly from their respective pivot means, each of said vanes being convexly bowed in a direction to present their concave surfaces uppermost when thus overlapped.

2,109,321
TELEVISION

Fritz Schröter, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application January 5, 1935, Serial No. 500
In Germany December 12, 1933
2 Claims. (Cl. 178—7.2)



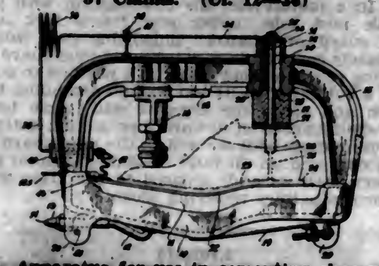
1. In combination, optical means for scanning an object by elemental linear strips, an evacuated envelope having means included therein for developing an electron beam, said envelope having positioned therein in register a plurality of discrete conducting elements, a plurality of light sensitive elements without said envelope and insulated each from the other, means for electrically joining each of the said discrete conducting elements to at least one of said light sensitive elements, means for sequentially projecting the elemental linear light strips upon the aforesaid light sensitive elements, means for developing individual electric charges on each of the discrete conducting elements proportional to the light intensity impinging on the light sensitive element to which it is electrically joined, means for storing said individually developed charges, means for circularly directing the electron beam sequentially across the conducting elements for discharging said stored charges, and a load circuit connected to said discharging means.

2,109,322
AUTOMATIC RECORD CHANGING PHONOGRAPH

Thomas W. Small, Fort Wayne, Ind., assignor, by mesne assignments, to Reconstruction Finance Corporation, Chicago, Ill., a corporation

Application March 13, 1936, Serial No. 68,673
22 Claims. (Cl. 274—10)

14. In an automatic phonograph, a horizontal turntable, a record magazine for containing a group of records to be reproduced on said turntable, means for pivotally supporting said magazine to one side of the turntable so as to permit it to swing from one horizontal position to another with the sides thereof alternately uppermost, means for transferring records laterally from the magazine to the turntable and from the turntable to the magazine when said magazine is



horizontally disposed, means for swinging said magazine from one horizontal position to the other after each record is reproduced, and means for displacing said magazine vertically relative to the turntable and transfer means during every alternate swinging movement so as to receive a record below the group when in uppermost position and above the group when in lowermost position.

2,109,323
SHOE CEMENTING APPARATUS

John Frederick Smith, Quincy, Mass., assignor to Compo Shoe Machinery Corporation, New York, N. Y., a corporation of Delaware

Application July 8, 1937, Serial No. 152,501
57 Claims. (Cl. 12—36)

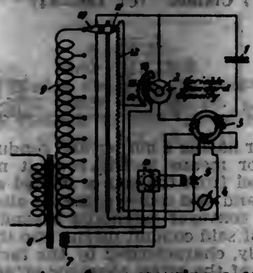
1. Apparatus for use in cementing shoe parts together, comprising a shoe press having a work engaging face which is yieldable and capable of applying pressure to work held thereagainst, a condenser electrode on the face, abutment means to hold work against the face, a second metallic condenser electrode associated with said abutment means whereby shoe parts to be cemented together may be held between said electrodes, and electrical conducting means connected between said electrodes including a coupling coil mounted on said press for cooperation with a coupling coil in a high frequency oscillator circuit mounted near a shoe press carrier.

2,109,324
SHOE

John Thomas Tebbutt, Three Rivers, Quebec, Canada

Application February 11, 1936, Serial No. 63,390
10 Claims. (Cl. 36—8.5)

1. A shoe comprising an outsole, an insole having circulatory openings, a medicated interim sole forming an insert between the outsole and insole, and a troughed stiffener introduced with-



in the shank of the shoe and constituting a distributing passage for the vapors from said interim sole.

2,109,325
SYSTEM FOR MEASURING A COMPONENT OF AN ALTERNATING CURRENT OR AN ALTERNATING VOLTAGE

Wilhelm Thal, Berlin-Charlottenstadt, Germany, assignor to Siemens & Halske, Aktiengesellschaft, Siemensstadt, near Berlin, Germany, a corporation of Germany

Application July 20, 1934, Serial No. 735,239
In Germany August 3, 1933
9 Claims. (Cl. 175—183)

1. In a system for measuring a component of an alternating current, a source of alternating current comprising means for varying the voltage of said source, a two-branch circuit connected with said source, one of said branches forming a test circuit of the current to be measured, the other of said branches forming a reference circuit, a differential transformer having two primary windings arranged to counteract each other and a common secondary winding, each of said primary windings being series connected in one of said two-branch circuits, means for balancing the magnitude of the current flowing in said reference circuit with the magnitude of the current flowing in said test circuit and for adjusting a given phase of the reference current, a measuring instrument connected in the circuit of said secondary winding, means in said secondary circuit for referring the indication of said measuring instrument to a given phase of said reference current, and means for varying the sensitiveness of said measuring instrument, said means being operatively connected with the aforesaid means for varying the voltage of said alternating current source in order to decrease the sensitiveness of said instrument with increasing voltage of said current source.

2,109,326
STEAM-ELECTRIC PRESSING IRON

Agatino Tricomi and Edward B. Tricomi, Brooklyn, N. Y.

Application April 27, 1936, Serial No. 76,566
1 Claim. (Cl. 38—77)

In combination with a steam pressing iron having a body, a heating element in said body, a chamber in said body in thermal conductivity with said heating element, a water reservoir supported by said iron, a pump for forcing water from said reservoir to said chamber whereby steam may be generated when said iron is heated, said chamber having an outlet pipe, passages connecting said outlet pipe to the bottom of the iron to allow steam to pass to the work, and a member for actuating said pump nor-

mally in one position but shiftable to another position, valve means for closing said outlet to build up steam pressure in said chamber, and a valve actuating element attached to said valve means and selectively engageable or not with said pump actuating member in its shifted position whereby said valve means or, said valve means and said pump, together, may be selectively actuated by a single operation.

2,109,327
BRAKE-RELINING MACHINE

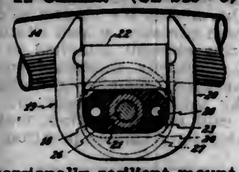
Harry B. Barrett, St. Louis, Mo., assignor to H. B. Barrett Company, Ltd., Los Angeles, Calif., a corporation of Nevada

Application October 14, 1936, Serial No. 105,474
10 Claims. (Cl. 29—26)

1. In a brake-relining machine, combined grinding and drilling means comprising a motor, a shaft rotatable with the motor, an abrading wheel mounted for rotation on the shaft, gear means operatively mounted on the shaft forwardly of the abrading wheel, and a drilling tool operably connected for rotation to the gear means, said abrading wheel and said drilling tool all being disposed substantially within a unitary housing, having a catch-bag communicatingly mounted thereon for receiving the combined waste products, dust, and chips resulting from grinding and drilling operations.

2,109,328
TAPE BINDING AND PACKAGE CLOSING MACHINE

John William Capstick, Verdun, Quebec, Canada



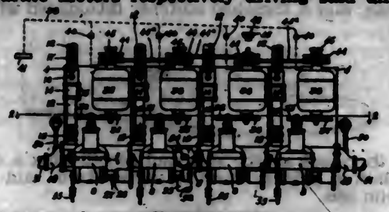
Application August 21, 1936, Serial No. 96,756
3 Claims. (Cl. 91—14.5)

1. In a tape binding and package closing machine, an extended frame forming a tape pas-

sageway and supporting a water reservoir, a moistener suspended from said frame and flexibly connected with said reservoir, and means to bring said moistener into contact with the tape against spring pressure.

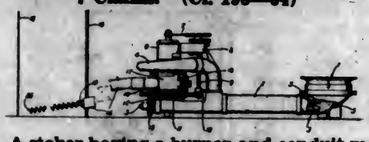
2,109,229
ENGINE MOUNT
Ralph D. Carleton, Snyder, N. Y., assignor, by mesne assignments, to Curtiss-Wright Corporation, a corporation of New York
Application April 12, 1934, Serial No. 720,192
Renewed November 20, 1937
11 Claims. (Cl. 248—5)

1. In a torsionally resilient mount for an aircraft engine including a mounting ring, a plurality of circumferentially spaced lugs thereon, each said lug comprising a U-shaped member having parallel elements thereof parallel to the ring axis, the legs of the U being attached to the ring to define an elongated opening bounded by the interior surface of the U member and by a portion of the ring, a resilient block closely fitting in said elongated opening, and means parallel with said ring axis passing through said block and bearing on both sides of said lug for holding the engine against movement in any direction except circumferential movement on said ring, said circumferential movement being limited by the bearing of said means against said resilient block.



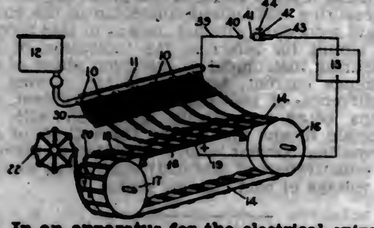
2,109,230
SIGN
Bates Compton, Vincentown, N. J.
Application June 22, 1937, Serial No. 149,688
5 Claims. (Cl. 40—152)

1. A sign or the like, comprising a frame formed with a groove in one face thereof, a display member formed of a sheet of flexible material extending over the frame and projecting into the groove, and means including a clip fitted over the frame on top of the flexible member and engaging in the groove for releasably holding the display member in position.



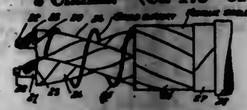
2,109,231
PROPORTIONING DEVICE
Mead Cornell, Cleveland, Ohio, assignor to The Cornell Machine Company, Cleveland, Ohio, a corporation of Ohio
Application January 13, 1937, Serial No. 120,253
14 Claims. (Cl. 137—164)

1. In a proportioning device, the combination of a plurality of separate pumping units arranged to discharge into a common outfall manifold, separate motors respectively driving said units,



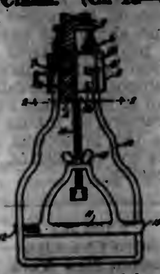
and means for coupling any two or more of said pumping units to maintain synchronized the speed of operation thereof.

2,109,232
STOKER
John F. Fisher, Manheim, Pa., assignor to Henry M. Brooks, New York, N. Y., William Tudor Gardiner, Boston, Mass., and Jacob H. Nissley, Manheim, Pa., as trustees
Application July 2, 1936, Serial No. 88,709
7 Claims. (Cl. 198—64)



1. A stoker having a burner and conduit means and conveyor means in the conduit means to transport fuel from the source of fuel supply to the burner, and said conveyor means also including a screw conveyor extending beyond the entrance end of said conduit means into the source of fuel supply, characterized by the fact that at least a part of the screw conveyor extension beyond the conduit end is flexible at a plurality of places along its length, so that the end of the extension remote from the conduit end can move bodily with respect to the portion of the conveyor means that is within the conduit.

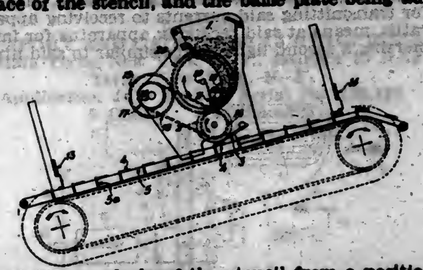
2,109,233
ARTIFICIAL FIBER CONSTRUCTION
Anton Fernbach, Mainz, Germany, assignor of forty-five one-hundredths to Richard Schreiber-Gastell, Mainz, Germany
Application August 15, 1936, Serial No. 96,225
In Germany March 4, 1936
9 Claims. (Cl. 18—8)



5. In an apparatus for the electrical spinning of fibers, a spinning nozzle, a fiber collecting device, means for creating a high electrical potential between said nozzle and said device, and means connected in series with said means for creating said high electrical potential for periodically reducing said potential at substantially regular intervals of such periodicity as to control the length of said fibers.

2,109,234
COMMUNICATION CABLE COMPRISING ONE OR MORE SCREENED CORE GROUPS
Heinrich Kadow, Berlin-Siemensstadt, Paul Thomas, Berlin-Wilmersdorf, and Hans Wassmannsdorff, Berlin-Spandau, Germany, assignors to Siemens & Halske, Aktiengesellschaft, Siemensstadt, near Berlin, Germany, a corporation of Germany
Application July 17, 1935, Serial No. 31,780
In Germany July 17, 1934
3 Claims. (Cl. 173—31)

1. In a long distance communication cable for low and high frequencies, having at least one group of cores twisted together about a common axis, a screen surrounding said group, said screen consisting of a plurality of good conducting strand elements laid side by side helically around said group and following individually the direction of the cores in said group.



2,109,235
MOP HOLDER
Simeon C. Lawler, Chicago, Ill., assignor to Eva E. Beery, Chicago, Ill.
Application October 6, 1934, Serial No. 747,144
1 Claim. (Cl. 15—153)

In a mop holder, a wood handle, a metal cap thereon having grooves on either side thereof terminating in openings therethrough, a wire frame having its ends turned inward registering with said openings and lying partly within said slots, a stud inserted in the end of said cap and supporting a clamp which cooperates with said frame to hold a mop fabric, and a sleeve having grooves registering with ends of the wire frame lying in the slots and slidable back and forth on the handle to hold the wires in the slots or permit removal therefrom.

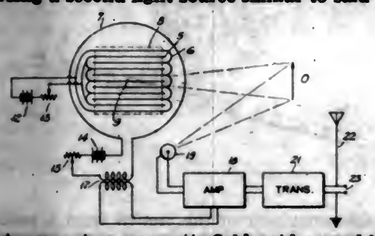
2,109,236
MACHINE FOR DEPOSITING CREAM, CHOCOLATE, OR THE LIKE ON BISCUITS
Leonard Marsden, Newton-le-Willows, England
Application July 1, 1936, Serial No. 88,422
In Great Britain July 10, 1935
6 Claims. (Cl. 107—27)

1. A depositing machine comprising a container having two side walls, a transverse wall and a baffle plate, a hollow rotary cylindrical stencil passing from the container between the transverse wall and the baffle plate, a carrier roller co-operating with the cylindrical stencil at the point of emergence from the container, the transverse wall being shaped to a feather edge to fill the bight between the osculating members and being stepped on its inner side so as to wipe the outer face of the stencil, and the baffle plate being adjustable angularly of the stencil from a position just above the feather edge of such transverse wall to positions away from it to vary the thickness of the deposit.

2,109,237
AMORPHOUS SILICA DRILLING FLUID
Owen Mayfield, Houston, Tex., assignor to Corona Products, Inc., Rogers, Ark., a corporation of Arkansas
No Drawing. Application September 9, 1935, Serial No. 39,919
2 Claims. (Cl. 255—1)

1. A drilling fluid comprising approximately 99% of amorphous silica divided finely to pass through a 325 mesh screen, and about 1% of clay of a soft friable nature and free from all sands and grit, said drilling fluid having an absorption capacity of about 50% of water.

2,109,238
FLAT HAIR CURLER
Harry Nathiel, Bronx, N. Y., assignor to Henry Engelke, New York, N. Y.
Application October 6, 1936, Serial No. 104,238
2 Claims. (Cl. 132—41)



1. A hair curler comprising a flat strip of sheet material, having a slot extending inward from one end substantially to the opposite end, forming two legs of flat material positioned in the same plane and lying edge to edge, and joined together at one end forming the head of said curler, said head having recesses in the opposite sides beyond the end of the slot, and an opening therethrough also beyond the end of the slot, and the opposite end of said curler, into which the said slot extends, shaped with outwardly sloping surfaces forming the inner edges of the ends of said legs.

2,109,239
VARIABLE SPEED TELEVISION
Alexander McLean Nicolson, New York, N. Y., assignor to Communication Patents, Inc., New York, N. Y., a corporation of Delaware
Application February 8, 1934, Serial No. 710,289
7 Claims. (Cl. 178—6.8)

1. In a television transmission system, the combination of means for producing a primary light source having a constant intensity at all times, said light source comprising an ionized path, means for immersing said light source in a

magnetic field for moving said source, means for projecting the light from said source to an object to be scanned, means for translating the light from said object into electrical currents, means for transmitting said currents to receiving apparatus, means at said receiving apparatus for immersing a second light source similar to said first

light source in a magnetic field, said second light source having a constant intensity at all times, and means for impressing said received currents on said immersing means for varying the speed of said light source in accordance with the light and shade densities of said object being scanned by the transmitter.

2,109,240

NEW CATALYSTS

Julius A. Nieuwland and Frank J. Sowa, Notre Dame, Ind., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 11, 1934, Serial No. 747,892

16 Claims. (Cl. 23—152)

1. Dihydroxyfluoboric acid having a boiling point of 159° to 160° C. and a specific gravity of 1.657 at 25° C.

2,109,241

ELECTRIC LIGHTING APPARATUS

Carl Rebl, Brooklyn, N. Y.

Application January 23, 1936, Serial No. 60,429

1 Claim. (Cl. 173—337)

A convertible socket for tubular bulbs and the like comprising an annular member formed of insulating material, a plug cooperable to project into and releasably engage the inner surface of the annular member, said plug being formed with a chamber on one side, a first contact element mounted on a spring in the chamber and adapted to engage the end of a tubular light bulb, a second contact element electrically connected to the first contact element and rigidly mounted on the side of the plug opposite the chamber so as to be exposed through the annular member when the plug is positioned therein, and a third contact element disposed between the inside of the annular member and the outer surface of the plug, said plug and annular member being formed so that the third contact element is accessible to a prong projected between the annular member and plug from the side opposite the chamber in the plug, and said second contact element being adapted to engage the end of a tubular light bulb or in cooperation with the third contact element to engage and support an adapter.

2,109,242

PRINTING ATTACHMENT FOR PENCILS

Carl Rebl, Brooklyn, N. Y.

Application July 17, 1937, Serial No. 154,248

2 Claims. (Cl. 101—103)

1. In a device of the class described, in combination, a casing open at its upper end, a printing device within the casing, a flexible band carrying printing characters, a support for said band spanning the opening at one end of the casing, the upper surface of the support being in the same plane as the edge of the opening, means for moving said flexible band to position the characters thereon on the upper surface of the support in a plane above the edge of the opening, and means projecting from the casing at opposite diametrical points to move said flexible band about the support, a removable cap for covering the open end of the casing and the projecting printing characters, an inking pad within the cap for engaging the projecting printing characters, and means for connecting the cap to the open end of the casing.

2,109,243

SUSPENDERS

Hymin Reiter, New York, N. Y.

Application May 6, 1937, Serial No. 141,126

2 Claims. (Cl. 241—20)

1. A four-swing suspender, comprising shoulder straps having their front ends provided with trouser engaging elements, a pair of back straps having their lower ends provided with trouser engaging elements, elongated flexible sheet material means extending transversely of said straps and having a pair of widely spaced top openings and

a pair of closely spaced bottom openings, flexible sheet material elements looped through said openings and respectively secured to the upper and back ends of said back and shoulder straps, whereby said back straps are closely spaced for convenient attachment of the trouser engaging elements to the back of the trousers and said shoulder straps are widely spaced for extending over one's shoulders, said widely spaced top openings being formed in adjacent lapel portions having their adjacent edges extending away from each other and forming a junction point at the bottom thereof, and means for drawing said edges together to different distances for changing the spacing of said openings.

2,109,244

GROUND JOINT PIPE COUPLING

Henry L. Selger, Newton, N. J.

Application May 28, 1937, Serial No. 145,180

3 Claims. (Cl. 285—120)

1. In a pipe coupling comprising male and female members having mating conical faces, one of said members having an annular shoulder thereon, the other of said members having threads thereon, and a coupling nut having a flanged portion and a threaded portion to engage said annular shoulder and threads, respectively, for drawing and holding said members together, means comprising axially projecting lugs on the female member, and cooperating recesses in the male member, the lugs on said female member being disposed radially outward of the conical face of said male member, said cooperating recesses being in the conical face of said male member, and said lugs being shorter than the threaded portion of said coupling nut.

2,109,245

ORNAMENTAL ADJUSTABLE SHOULDER STRAP

Herman Silverman, New York, N. Y.

Application July 21, 1936, Serial No. 91,651

5 Claims. (Cl. 241—12)

1. An ornamental adjustable shoulder strap comprising an adjustable shoulder strap including a looped strap portion having its end attached upon a buckle slidable on said strap, an annular element passing through said loop, an anchorage strap formed with apertures and also passing through said annular element but extending in the opposite direction, an ornament associated with said anchorage strap, and an endless band passing through said apertures in said anchorage strap and having said ornament mounted thereon so that the position of said ornament may be changed with relation to the annular element.

2,109,246

SUPPORT AND GAUGE FOR CURTAIN RODS

Natale Terzo, New York, N. Y., assignor to John Terzo, New York, N. Y.

Application July 8, 1937, Serial No. 152,499

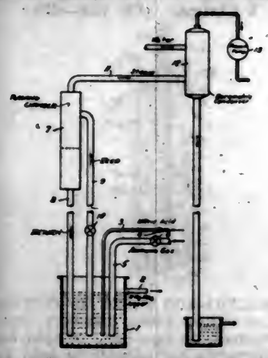
5 Claims. (Cl. 156—22)

3. In a support and gauge for curtain rods, a base plate, a clamp plate hingedly and slightly slidably mounted on one edge of said base plate, fastening elements for attaching said base plate on a window frame or the like and having heads engaging bayonet slots in said clamp plate for holding said clamp plate against hinging in its lowered position, a curtain rod support engaging in a groove formed between said plates, and an element on said rod engaging one branch of a slot with a plurality of branches formed in said clamp plate for supporting said rod in an elevated position, said hinged and slidable connection comprising tubular portions turned in from the edges of the base plate and clamp plate and superimposed and slightly spaced from each other, pintles engaging through said tubular portions, and expansion springs coaxial upon said pintles and disposed between said tubular portions, said fastening elements comprising headed screws or the like.

2,109,247

PROCESS AND APPARATUS FOR THE PRODUCTION OF SALTS

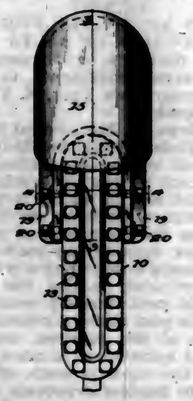
Herman Albert Beekhuis, Jr., Syracuse, N. Y., assignor, by mesne assignments, to The Solvay Process Company, New York, N. Y., a corporation of New York



Application June 13, 1931, Serial No. 544,112

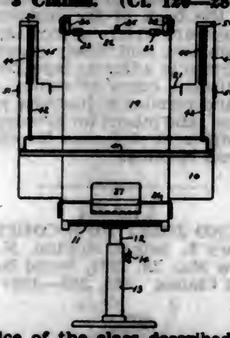
20 Claims. (Cl. 23—103)

1. The process for the production of a reaction product which is normally a solid from components, at least one of which is readily volatilized and which undergo an exothermic reaction resulting in the formation of said product, which comprises introducing said components into a pool of liquid comprising a solution of the reaction product, and causing the components to react in said pool, thereby generating heat, maintaining said pool under a pressure above the vapor pressure of the solution, transferring a portion of said solution to a zone in which a pressure below the vapor pressure of the solution is maintained to thereby evaporate solvent from said solution, whereby the solution thus subjected to evaporation is cooled, and returning the thus cooled and concentrated solution to said pool whereby said pool is cooled and volatilization of said components therein is minimized.



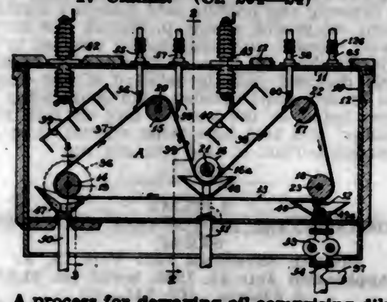
16. The process for the production of a solution containing ammonium nitrate by reaction

of ammonia with an aqueous solution containing nitric acid while utilizing the heat of reaction of the ammonia and acid to evaporate water introduced with said solution of nitric acid, which comprises continuously cycling an aqueous liquor containing ammonium nitrate dissolved therein through a plurality of stages, in one of said stages reacting ammonia and nitric acid in said aqueous liquor to form ammonium nitrate



under a pressure at which boiling of the liquor at the temperature to which it is heated by the heat of reaction liberated therein is prevented, and in a subsequent stage subjecting the thus heated liquor to a pressure sufficiently below the pressure in the first stage to cause the liquor to boil and water to be evaporated therefrom by said heat of reaction and returning to the first mentioned stage aqueous liquor cooled by said evaporation of water.

2,109,348
ILLUMINATED BOILER WATER LEVEL GAUGE
Alva G. Blanchard, Shreveport, La.
Application August 3, 1936, Serial No. 94,679
1 Claim. (Cl. 73—293)



The combination of a gauge casing, a reflector and a source of light carried within and partially concealed by the reflector, said reflector having a bifurcated extension, the arms of said bifurcated portion slidably engaging the opposite side surfaces of said gauge casing, and means releasably locking said arms on said casing.

2,109,349
STENOGRAPHER'S NOTEBOOK AND COPY HOLDER
Charles C. Clifford, Maplewood, N. J.
Application December 15, 1936, Serial No. 115,933
3 Claims. (Cl. 129—28)

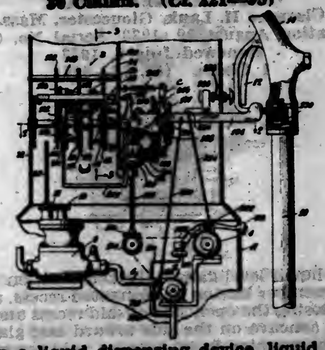
1. A device of the class described comprising, a base, a receptacle adjustably mounted on said base, and sockets provided in opposite sides of said receptacle for receiving the bracket of a copy holder.

2,109,350
PROCESS AND APPARATUS FOR DEWAXING OIL
Lyle Dillon, Los Angeles, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Application August 3, 1936, Serial No. 93,958
17 Claims. (Cl. 204—24)

1. A process for dewaxing oil comprising diluting waxbearing oil with a solvent, precipitating wax in the resultant solution, subjecting the mixture to an electric field, depositing the wax precipitate under the influence of the electric field in a layer upon an electrode surface and withdrawing the thus separated wax-free oil, subjecting the electrically deposited wax layer on said electrode to washing with a quantity of solvent while free from the influence of an electric field, subsequently subjecting the washed wax layer to an electric field and to further solvent wash under the influence of the electric field to remove wash solvent and occluded oil from the wax separately collecting and removing the said wash solvent and occluded oil and removing the thus treated wax from the electrode surface.

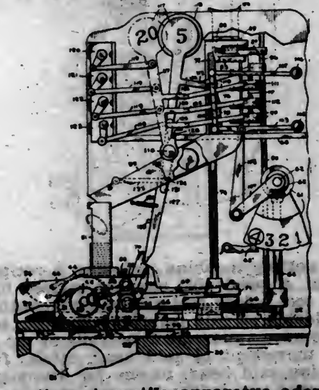
2,109,351
OIL WELL VALVE
Charley W. Fisher, Coffeyville, Kans.
Application January 8, 1937, Serial No. 119,666
7 Claims. (Cl. 166—10)

1. A valve of the character described, comprising an upper body portion, a lower body portion carrying an apertured sleeve anchored to the lower body portion and telescopically mounted



within the upper body portion, both upper and lower portions having cooperating valve seating surfaces which will seal against each other when telescoped in one direction.

2,109,352
AUTOMATIC ZEROIZER FOR DISPENSING PUMP
Charles S. Hazard, New York, N. Y., assignor to Neptune Meter Company, a corporation of New Jersey
Application June 2, 1936, Serial No. 83,029
17 Claims. (Cl. 221—95)



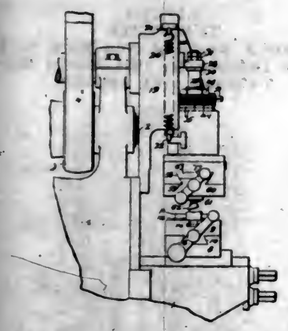
1. In a liquid dispensing device, the combination of a meter, an indicator movable away from an initial position in proportion to the quantity of liquid dispensed, means for actuating the indicator in response to operation of the meter, means for resetting the indicator to said initial position, means for alternately operating the indicator actuating means and the resetting means and means actuated upon movement of the indicator to initial position for rendering the resetting means inoperative and the indicator actuating means operative.

2,109,353
AUTOMATIC ZEROIZING DEVICE FOR DISPENSING PUMPS
Charles S. Hazard, New York, N. Y., assignor to Neptune Meter Company, a corporation of New Jersey
Application June 2, 1936, Serial No. 83,030
20 Claims. (Cl. 221—95)

1. In a liquid dispensing device, liquid metering means, means for delivering liquid to said metering means, an indicator controlled by said metering means and movable away from an initial position in proportion to the amount of liquid dispensed, means for resetting said indicator to said initial position during operation of said liquid delivering means, automatically operating means energized independently of said metering means for actuating said resetting means and means controlled by said indicator preventing delivery of liquid from said liquid delivering means to said liquid metering means until said indicating means has been restored to said initial position.

2,109,354
TURNSTILE
William J. Kennedy, New York, N. Y.
Application October 21, 1935, Serial No. 45,848
3 Claims. (Cl. 194—63)

3. A unitary turnstile apparatus adapted for use in fare zone transportation systems, including magazine retainers for tokens of different diameters for each of the zones of the system, mechanism, operable by the passengers entering through the turnstile, for dispensing the tokens, mechanism for receiving the tokens, operable by the passengers exiting through the turnstile, to

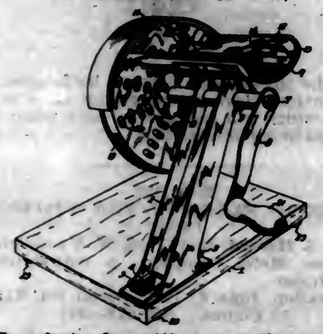


indicate the correct fare for each passenger, and means, associated with said second named mechanism, for sorting and returning the tokens to the proper magazines after use.

2,109,255
LIQUID LEVEL GAUGE
Clarence H. Lank, Gloucester, Mass.
Application August 29, 1933, Serial No. 687,280
Renewed July 8, 1937
1 Claim. (Cl. 73—327)

In a liquid level gauge, the combination with a metal member having an elongated recess, a glass plate closing the open side of said recess and a reflector, concave on the side toward said glass, removably mounted in said recess, said recess having openings for communication with the receptacle, the level in which is to be observed, said openings being separated at the rear of and at each side of said reflector.

2,109,256
SLOTTING MACHINE
Louis G. Larsen, Jersey City, N. J., assignor, by direct and mesne assignments, to Wirthsen Associates, Inc., New York, N. Y., a corporation of New York
Application March 16, 1937, Serial No. 131,114
23 Claims. (Cl. 90—44)



1. A slotting machine including a reciprocating head, a revolvable member carried by said head, a tool holder and means for mounting the same slidably on said revolvable member to permit it to have a movement laterally of the direction of movement of said head, means for reciprocating said head, means for automatically causing said tool holder to move laterally of the direction of movement of the head and simultaneously therewith, whereby a tool carried by said tool holder is caused to move through a piece of work in a diagonal direction, and means for revolving said revolvable member to change the radial direction of lateral reciprocation of said tool holder.

2,109,257
LUBRICATING OIL
Bert H. Lincoln, Ponca City, and Alfred Henriksen, deceased, late of Ponca City, Okla., by Ellen M. Henriksen, administratrix, Ponca City, Okla., assignors, by mesne assignments, to The Lubri-Zol Development Corporation, Cleveland, Ohio, a corporation of Delaware
No Drawing. Application January 22, 1934, Serial No. 707,783
7 Claims. (Cl. 87—9)

1. A lubricating oil comprising in combination a hydrocarbon oil and a small amount of a halogenated, natural occurring ester, having wax-like characteristics.

2,109,258
VEGETABLE CUTTER OR GRATER
Richard Rupert, Kansas City, Mo., assignor to Foster L. Talge, Kansas City, Mo., operating as Rival Manufacturing Company
Application August 26, 1935, Serial No. 37,832
3 Claims. (Cl. 146—116)

1. In a device for cutting or grating vegetables, a standard, a shaft journaled in said standard, a cutting means secured to said shaft for rotation therewith, a trough supported on said standard with one end thereof in proximity to said cutting means, a guide flange positioned in said trough and extending longitudinally thereof, a feeding member supported on said trough and adapted to be moved therealong for pressing a vegetable into contact with said cutting means, said feeding member being formed with guide means adapted to engage said flange, said flange having its upper edge lying substantially in a plane with the edges of said trough.

2,109,259
BOX-MAKING MACHINE
George Seifert, Beverly Hills Township, Los Angeles County, Calif.
Application February 15, 1937, Serial No. 125,733
9 Claims. (Cl. 93—42)

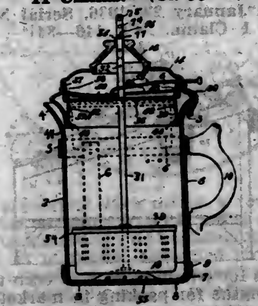
1. In a box-making machine, a table, a pair of folding bars mounted over said table, means for feeding an unfolded box over said table and under said guide bars, a first folding means comprising

a pair of rods and means for pushing the ends of said rods against two sides of said box for folding said sides respectively upwardly against the edges of said folding bars, a second folding means comprising a pair of rods and means for pushing the ends of said rods against said upwardly folded sides of the box for folding said sides downwardly over said folding bars in position with their edges in overlapping relation, and means for securing said overlapping edges together.

2,109,260
CONVEYER APPARATUS
Frederick Shurley, Salt Lake City, Utah, assignor to Ceramic Machinery Distributors Limited, Windsor, Ontario, Canada, a company of Canada
Application December 31, 1935, Serial No. 57,016
6 Claims. (Cl. 101—40)

3. In combination, a rotary carrier having pockets to receive articles to be printed, a flat printing member movable tangentially with respect to said carrier and means for feeding articles to said carrier and means for removing said articles therefrom after the printing operation.

2,109,261
SAFETY DEVICE FOR HOMES
Yetta Spiegel, New York, N. Y.
Application May 6, 1937, Serial No. 141,125
4 Claims. (Cl. 95—11)



1. In combination with a passage for persons, a drop shelf for supporting a camera adapted to be trained upon said passage, an electric holding device for fixedly holding said shelf, and a chute system for conveying said camera to a place of safety upon dropping of said shelf, an electric operator for said camera and a circuit for controlling the said holding device and said electric operator, and a detector for controlling said circuit.

2,109,262
SYNCHRONIZATION INDICATING DEVICE
Paul L. Tollison, Plainfield, N. J., assignor to Weed Newspaper Machinery Corporation, New York, N. Y., a corporation of Virginia
Application January 27, 1932, Serial No. 589,233
Renewed November 4, 1935
3 Claims. (Cl. 235—103.5)

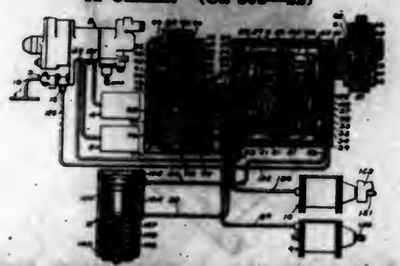
1. In a device for indicating synchronous rotation, the combination of a shaft connected to be driven by one of the two elements to be tested and an annulus adapted to be rotated by surface contact with the other of the two elements which are to be tested, a portable casing outside of which the annulus is located, said shaft entering said casing axially, a second shaft in the casing in axial alignment with the first shaft and to which the annulus is fixed, a differential mechanism in the casing connecting the two shafts, a drum carrying part of the differential and means whereby the casing can be moved to bring the annulus into contact with the exterior convex surface of one rotating element to be tested.

2,109,263
COFFEEPOT
William Erastus Williams, Los Angeles, Calif., assignor to The Parfex Company, a corporation of California
Application September 22, 1934, Serial No. 745,076
11 Claims. (Cl. 53—3)

1. In a pot of the class described, the combination with a foraminous grounds carrying basket of a foraminous and detachable closure, to permit the flow of liquor to the interior of said basket and prevent the escape of grounds therefrom, a central sleeve rigidly attached to said basket, a fountain tube adapted to pass through said sleeve and to permit said basket to slide freely thereon up and down within the pot into and out of the liquor in the pot while the said fountain tube is located in stable vertical position, a cover for the pot having mounted thereto anchoring means for supporting the said basket in an upward position, said fountain tube passing thru the said basket and thru the top of the

cover and adapted to slide up and down thru said basket and cover, against sufficient frictional resistance to support said fountain tube and manually operated means for releasing said basket from said cover.

2,109,264
ELECTRIC SPARK PLUG OR THE LIKE FOR INTERNAL COMBUSTION ENGINES
Hermann Georg Bermuemann, Zehlendorf-Klein Machnow, Germany
Application April 17, 1935, Serial No. 16,845
In Germany April 17, 1934
16 Claims. (Cl. 123—169)



1. A spark plug, comprising in combination, a metal casing forming the outer electrode, an insulating body inserted in and projecting from the said casing to form a radiating surface and having an axial bore, a metal pin extending through said bore and forming the inner electrode, said insulating body consisting of a material having high heat conductivity, and means on the projecting end of said insulating body for adjusting the exposed area of the radiating surface.

2,109,265
CORN TRIMMING MACHINE
Clarence E. Carll and Willis G. Carll, Gorham, Maine
Application January 28, 1936, Serial No. 61,206
1 Claim. (Cl. 146—84)

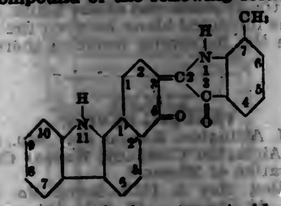
Apparatus for trimming ears of corn to predetermined lengths for packing in marketing containers, comprising a supporting frame, a conveyor adapted to carry ears of corn from one end to the opposite end of said apparatus, said conveyer embodying two pulleys disposed, respectively, at the two ends of said apparatus, a central V-shape circumferential groove in the rim of each of said pulleys, an endless belt operating over said pulleys, a continuous V-shape guide strip secured to and disposed on the inner face of said endless belt, adapted to travel in said grooves and hold the belt in central, longitudinal alignment with said pulleys, two circular saws mounted on said supporting frame, disposed, respectively, adjacent the sides of said conveyor and between said pulleys, means to space said saws, relatively, at various distances whereby the ears of corn may be trimmed to various, predetermined lengths, a plurality of corn-engaging flights secured to and arranged along said endless belt, the forward faces of said flights having corn-receiving depressions set at a slightly oblique angle with respect to a right line transversely of said conveyor, and a swinging arm mounted above and between said saws having a face of opposite obliquity to that face of the flight in which is the said depression, said arm adapted to engage one side of the ear of corn while the opposite side is being held in the depression in the adjacent flight during the saw-cutting operation.

2,109,266
EMPTY AND LOAD BRAKE
Earle S. Cook, Williamsburg, and Ellis R. Hewitt, Edgewood, Pa., assignors to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application November 27, 1935, Serial No. 51,798
Renewed October 11, 1937
41 Claims. (Cl. 303—33)

36. In a car load brake apparatus, in combination, a brake pipe, valve means operative between two positions to condition the brake apparatus for either empty or loaded car braking, and means operative upon a predetermined increase in brake pipe pressure and independently of the operation of said valve means for holding the valve means against movement from at least one position to the other.

2,109,267
SHOCK ABSORBER
Arnold E. Deutler, Hinsdale, Ill., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware
Application July 5, 1935, Serial No. 29,823
11 Claims. (Cl. 267—9)

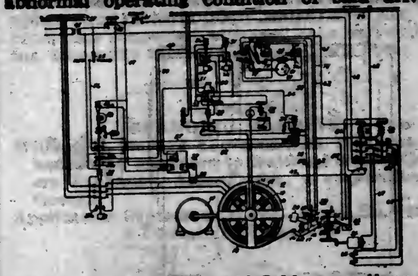
1. In a shock absorbing mechanism, the combination with a non-expandible friction casing having an inwardly tapered friction shell section; of a one-piece friction member telescoped within said friction shell section and movable inwardly and outwardly of the shell, said member including a tubular section closed at the inner end by a transverse wall and having a spring abutment at the outer end, said tubular section being radially contractible; and a spring resistance bearing on said abutment and opposing relative movement of the casing and friction member.



2,109,268
HIGH VOLTAGE BUSHING
Eugene D. Eby, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York
Application September 15, 1936, Serial No. 100,871
3 Claims. (Cl. 173—318)

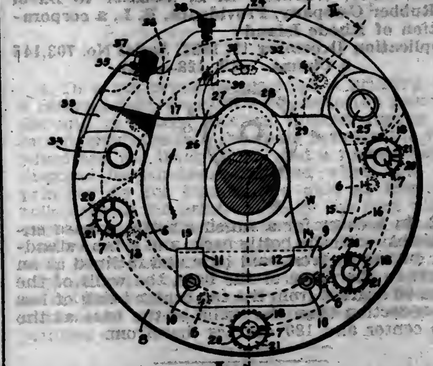
1. A liquid filled bushing including a hollow axial conductor and an expansion chamber for the liquid, said expansion chamber including a cap having a shoulder and a smooth cylindrical surface surrounding and spaced from the conductor, a ring threaded onto the conductor and sealed to the cap, an elastic seal secured to the ring between the conductor and the cylindrical surface of the cap, and a compression spring between the seal and said shoulder.

2,109,269
DYESTUFF OF THE INDIGOID TYPE
Samuel Ellingworth, Blackley, Manchester, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application September 11, 1935, Serial No. 40,609
1 Claim. (Cl. 260—48)



The compound of the following formula

which dyes cotton in from gray to black shades.

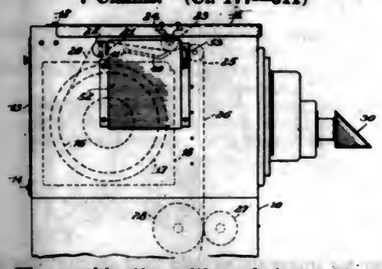


2,109,270
MOTOR CONTROL SYSTEM
Samuel Q. Ewing, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application April 12, 1935, Serial No. 16,192
8 Claims. (Cl. 172—239)

1. In combination, an electric driving motor having rotatable field and armature members, one of said members constituting a driving member, a brake for the other of said members, means for establishing power connections for said field and armature members, an auxiliary motor for applying said brake, and means responsive to an abnormal operating condition of said driving

motor for interrupting said field connections and controlling said auxiliary motor to release said brake and responsive to termination of said abnormal condition for re-establishing said field connections and controlling said auxiliary motor to re-apply said brake.

2,109,271
RESILIENT WORK DRIVING MEANS
William F. Greene, Cincinnati, Ohio, assignor to The R. K. Le Blond Machine Tool Company, Cincinnati, Ohio, a corporation of Delaware
Application July 17, 1936, Serial No. 91,165
18 Claims. (Cl. 82—49)



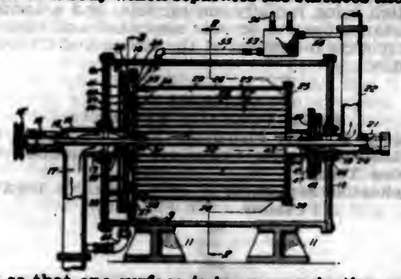
1. In a resilient work driver, a rotatable body, means for engaging a work piece, and resilient means for mounting said engaging means on said body so as to permit restricted circumferential relative movement of said engaging means and said body about the axis of rotation of the work driver.

2,109,272
DYE
James W. Hinds, Dallas, Tex., assignor of forty-nine percent to Paul J. Pond, Wichita Falls, Tex.
No Drawing. Application June 11, 1934, Serial No. 730,065
5 Claims. (Cl. 8—5)

1. In the art of preparing a dye bath the step of preparing a sulphur dye which consists of mixing substantially equal parts of dye and of pyridine whereby the dye will be dissolved in the pyridine.

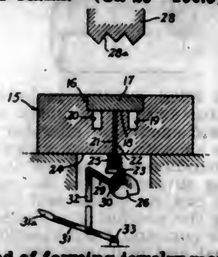
2,109,373
PHOTOGRAPHIC FILM INDICATOR
Paul Landrock, Rochester, N. Y., assignor to Photostat Corporation, Providence, R. I., a corporation of Rhode Island
Application February 1, 1933, Serial No. 654,671
7 Claims. (Cl. 177—311)

1. The combination with a photographic camera having a focal plane, of a supply of unexposed sensitized spliced film having a structural variation associated with each splice, means for moving successive portions of said film into the focal plane of the camera, and indicating means operated by said structural variation for indicating the approach of a splice to said focal plane.



2,109,374
CLOSURE FOR NURSING BOTTLES AND THE LIKE
Jesse Little, Warwick, R. I., assignor to Davol Rubber Company, Providence, R. I., a corporation of Rhode Island
Application December 19, 1933, Serial No. 703,145
2 Claims. (Cl. 128—252)

2. In a cover for a nursing bottle, a base engageable with the bottle neck, and a tab extending outwardly from said base and inclined at an angle to the plane of the base, the walls of the base 90 degrees from the tab center being of less cross-section than the walls of the base at the tab center and 180 degrees therefrom.

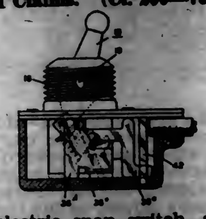


2,109,375
APPARATUS FOR EFFECTING COUNTER-CURRENT CONTACT BETWEEN FLUIDS
Walter J. Podbielniak, Chicago, Ill.
Application June 25, 1936, Serial No. 87,222
18 Claims. (Cl. 261—83)

1. In an apparatus for the counter-current contact of fluids in a zone of centrifugal force, a rotor having a spiral passageway, means for supplying a relatively heavier fluid within said rotor so that it flows outwardly through said passageway upon rotation, means for supplying a relatively lighter fluid to the outer end of said passageway under sufficient pressure so that it flows inwardly therethrough, means for discharging said lighter fluid from said rotor, means for discharging said heavier fluid from the rotor and a casing surrounding said rotor, said means for discharging said heavier fluid comprising a liquid seal means having a body of liquid therein, means forming a passageway for the flow of liquid from said body and having an extension into said body which separates the surfaces there-

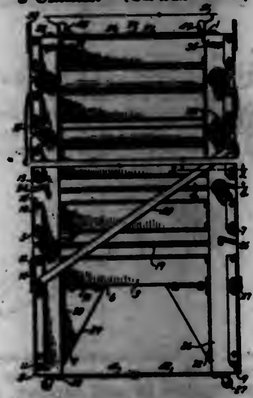
of so that one surface is in communication with the interior of the rotor and the other is in communication with the exterior of the rotor.

2,109,376
METHOD OF FORMING JEWELRY MOUNTINGS OR THE LIKE
Alfred F. Reilly, North Attlebero, Mass., assignor to Evans Case Company, North Attlebero, Mass., a corporation of Massachusetts
Application November 30, 1935, Serial No. 52,337
1 Claim. (Cl. 29—160.6)



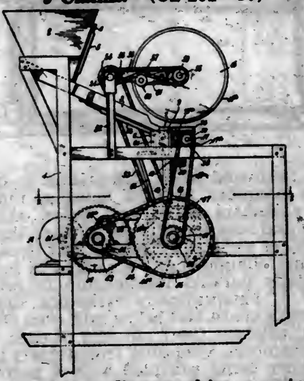
The method of forming jewelry mountings with deep indentations and elongated mounting lugs, comprising the steps of subjecting a metal blank seated in a die having a shank cavity and confined therein against lateral expansion, to repeated impacts of a plunger having a serrated cross-sectional outline, the repeated impacts being struck by the same plunger upon the blank seated in the same die, whereby the indentation produced at one end of the blank is successively deepened and a lug is formed and successively extended at the opposite end of the blank, and annealing the impacted blank between the impacts to remove the hardening resulting therefrom.

2,109,377
VENDING DEVICE
Marques J. Airington, Kansas City, Mo., assignor to The Airington Company, Kansas City, Mo., a corporation of Missouri
Application May 3, 1935, Serial No. 19,648
12 Claims. (Cl. 294—19)



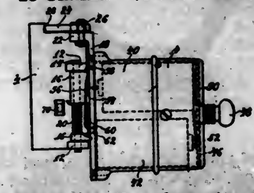
1. In a selector of the character described, a rod, a head on the rod having a stop lug, and a pair of yoke shaped hook members of differential size pivotally mounted on said head and engageable with said lug to selectively support one of said hook members in rigid relation with said head when engaged with a bottle.

2,109,378
SNAP SWITCH
Robert H. Bentley, Hartford, Conn., assignor to The Arrow-Hart & Hegeman Electric Company, Hartford, Conn., a corporation of Connecticut
Application July 8, 1936, Serial No. 89,642
11 Claims. (Cl. 200—76)



1. In an electric snap switch, an insulating base having a cavity therein for switch mechanism, a cover, an operating lever extending through said cover and having a portion extending into said cavity, a stamped sheet metal contact having a pair of parallel side plates slidable along and guided by the side walls of said cavity and connected by a saddle slidable along the bottom of said cavity, a yoke having a lug entering an aperture in said saddle for imparting movement of said yoke to said movable contact, and over-center spring means operated by said lever to move said yoke and movable contact with a snap, and a pair of stationary contacts engageable by said movable contact.

2,109,379
DISPLAY RACK
Charles M. Brown, Lincoln, Nebr.
Application January 27, 1936, Serial No. 61,016
3 Claims. (Cl. 242—55.4)



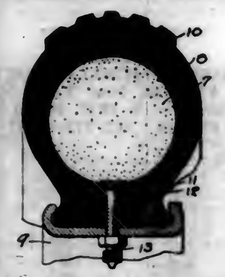
1. In a display rack, a plurality of spaced upright angle members having outwardly opening spaced slots terminating in rod supporting seats, rods having peripheral grooves at the outer ends engaged with said seats, vertically spaced horizontal plate members secured to the upright members between the slots over which rolls of merchandise may be drawn for display, angle clips for anchoring the end of the lowermost roll of merchandise carried on said rods in position to be displayed, bracing means connecting the upright members with the lowermost horizontal plate members, means in the interior of the rack for bracing the said plate members, caps at the upper ends of the upright angle members, and cross bars connected with said caps and extending diagonally thereof for bracing the rack.

2,109,380
BRANDING MACHINE
William P. Bullard and Oswell L. Williams, Albany, Ga., assignors to National Pecan Growers Exchange, Albany, Ga., a corporation of Georgia
Application September 7, 1937, Serial No. 162,786
9 Claims. (Cl. 101—37)

1. In a nut branding machine, a printing die, a resilient feed wheel located above the printing die and in spaced relation thereto, means for introducing nuts into the space between the feed wheel and the printing die, and a rocker trough disposed intermediate the feed wheel and the printing die for guiding the nuts as they are rolled across the printing die by the feed wheel, said rocker trough comprising a trough-shaped cradle having an opening in its bottom immediately above the printing die and means yieldingly supporting the cradle above the printing die but permitting depression of the cradle to allow the nuts to be pressed into engagement with the printing die.

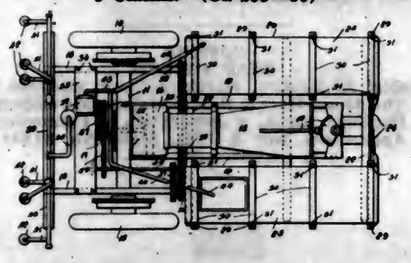
2,109,381
AUTOMOBILE SIGNALING DEVICE
Irving Fierman, New York, N. Y.
Application January 19, 1933, Serial No. 652,554
13 Claims. (Cl. 177—329)

1. In a device of the character described, a bracket, means on said bracket for securing it to the upper edge of the glass of an automobile door, said means including a U-shaped portion having a part of the bight of the U cut away, a signaling element pivotally mounted on the outer



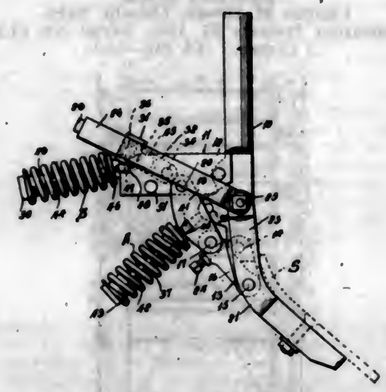
portion of said bracket, and movable to operative and inoperative positions, an operating lever pivotally connected to said signaling element for operating the same, said operating lever extending through the cut away portion of the bight, the thickness of the material of the bight being at least as great as the thickness of said operating lever.

2,109,382
OVEN
William H. Frick, Cleveland, Ohio, assignor to American Stove Company, St. Louis, Mo., a corporation of New Jersey
Application March 10, 1937, Serial No. 130,205
13 Claims. (Cl. 126—273)



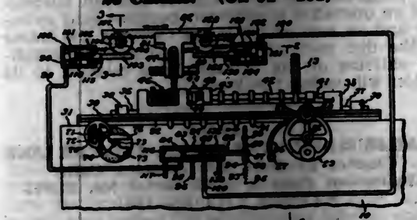
1. An improved oven, comprising a housing, an oven chamber in said housing, individual burner chambers above and below said oven chamber and substantially coextensive therewith, a plurality of vertically disposed partitions within said burner chambers and arranged in separated substantially parallel relationship to provide a plurality of longitudinally extending individual passageways above and below said oven chamber, a burner adjacent the front end of each of said burner chambers extending transversely thereof, each burner being provided with a plurality of burner orifices arranged in separated relationship throughout the length of the burner, a burner orifice being in alignment with one of the aforementioned passageways, a fuel supply for the burners, a door for the oven chamber, and flue outlet means for each of said burner chambers.

2,109,383
TIRE
Jose Gallardo, Santa Tecla, El Salvador
Application March 17, 1936, Serial No. 69,372
2 Claims. (Cl. 152—13)



1. A tire of the character described comprising an outer shoe adapted to be mounted upon the rim of a vehicle wheel, an inner tube for said shoe having an air valve associated therewith, said inner tube being filled with hard, fine sea sand, and a powdered absorbent material intermixed therewith and combined with air under pressure.

2,109,384
SPRAYING ATTACHMENT FOR TRACTORS
Charles A. Gallupe, Mars Hill, Maine
Application June 25, 1937, Serial No. 150,402
3 Claims. (Cl. 299—30)

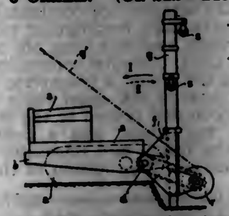


1. A spraying apparatus adapted to be attached to a tractor, wherein the tractor embodies rear traction wheels and a forward power plant, a frame structure adapted to be secured to the tractor in overlying relation thereto, two communicating tanks carried by the frame structure respectively at opposite sides of the power plant of the tractor and forwardly of the traction wheels, the frame structure extending rearwardly of the traction wheels, a pump supported on the rearwardly extending frame portion, means forming communication between the pump and tanks, spray devices rearwardly of the pump and in communication therewith and operative connections between the pump and power plant.

2,109,385
AUTOMATIC CULTIVATOR FOOT FOR TRACTORS
Mett L. Garrison and Alfred C. Garrison, England, Ark.
Application February 25, 1937, Serial No. 127,754
4 Claims. (Cl. 97—184)

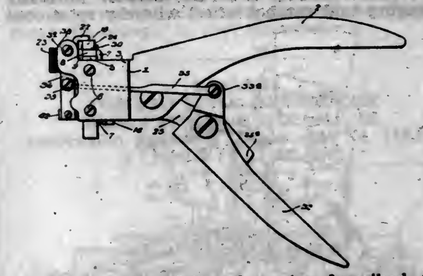
1. A device of the class described having a support, a plurality of parts in articulate relation pivoted at extremities to said support, a sweep-mounting shank pivoted to one of the parts in spaced relation to the support, spring means associated with said parts and adapted to be compressed through displacement of the shank, a strap means engaged with the shank above the axis of the latter, and spring means adapted to be compressed through the movement of the strap means.

2,109,386
CAM GRINDING APPARATUS
Clarence J. Green, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Continuation of application Serial Nos. 60,477 and 60,478, January 23, 1936. This application November 17, 1937, Serial No. 175,109
23 Claims. (Cl. 51—101)



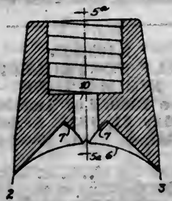
1. A cam grinding machine having a longitudinally movable table, means to traverse said table, a rotatable master camshaft, a cam follower movable longitudinally relative to said shaft, means for shifting said follower comprising a fluid pressure piston and cylinder, and means to control the admission of fluid to said cylinder.

2,109,387
TIN ALLOY
Daniel Hanson, Hasaler, Alcester, and William Thomas Pell-Walpole, Tipton, England, assignors to John Campbell, Kensington, England
No Drawing. Application July 10, 1936, Serial No. 89,998. In Great Britain February 9, 1935
2 Claims. (Cl. 148—13)



1. A method of producing a tin alloy which consists in adding to the tin an amount of cadmium in excess of 1 per cent. and not exceeding 15 per cent. and heating the alloy to a temperature exceeding 130° C. but less than the temperature at which the alloy begins to melt, and cooling rapidly, as by quenching or cooling in air.

2,109,388
LAND VEHICLE EQUIPPED WITH LOAD-SHIFTING DEVICES
Julius Heller, Vienna, Austria, assignor to The Cleveland Tractor Company, Cleveland, Ohio
Application July 16, 1935, Serial No. 31,664
In Austria July 24, 1934
6 Claims. (Cl. 212—145)

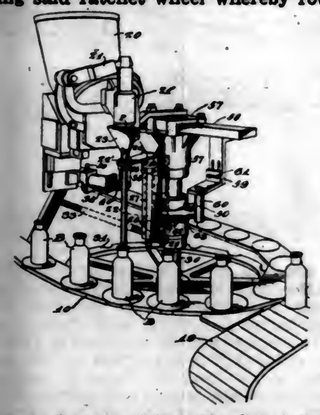


1. In combination, a crawler type tractor including spaced apart endless ground engaging tracks, a chassis frame connected to said tractor, rearwardly extending side frames horizontally pivoted to opposite sides of said chassis frame at its rear end, a mast carried centrally between said rearwardly extending side frames, and suitable lifting equipment mounted on said mast and between the ends of said side frames, said mast being adapted to contact with the ground when said frames are swung downwardly about their pivots.

2,109,389
REPRICER
George W. Henry, Jr., Philadelphia, Pa., assignor to Seabar Company, Philadelphia, Pa., a corporation of Pennsylvania
Application February 21, 1936, Serial No. 65,157
6 Claims. (Cl. 101—297)

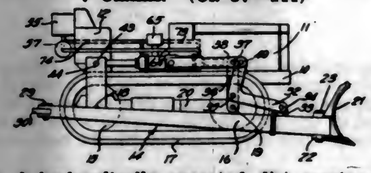
1. In a device of the character described, the combination with a support structure comprising a platen, of a type carrier mounted in said structure for reciprocation with respect to said platen, an inking member mounted in said structure for movement transversely to the path of said type carrier and arranged to engage the type face when said carrier is in a retracted position with respect to the platen, a lever for advancing the carrier toward the platen, and a second lever for first displacing the inking member from the path of the carrier and subsequently actuating the first lever to advance the carrier toward the platen.

2,109,390
DRILL BIT
Martin Hokanson, Duluth, Minn., assignor to Eidco, Inc., Duluth, Minn., a corporation of Minnesota
Application June 13, 1935, Serial No. 26,418
10 Claims. (Cl. 255—64)



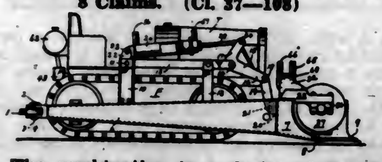
1. A drill bit of the type described having a concave cutting face consisting of a plurality of equally shaped cutting edges, said concavity being formed by the intersection of a spherical surface and cones with axes parallel with the axis of the bit.

2,109,391
APPARATUS FOR SURFACE TREATING GLASS CONTAINERS
Albert G. Lauck and Julius M. Johnson, Alton, Ill., assignors to Owens-Illinois Glass Company, a corporation of Ohio
Application July 29, 1936, Serial No. 93,240
2 Claims. (Cl. 49—14)



1. The combination with a conveyor for transferring bottles from a forming machine to an

annealing leer including a horizontal moving platform on which the bottles are received in spaced single file relationship, and a vertical shaft upon which one of the conveyor wheels is mounted, of a ratchet wheel mounted on said shaft for rotation in unison therewith, a radial support pivoted to said shaft for swinging movement in either direction in a horizontal plane, a stationary abutment, means normally urging said support into engagement with said abutment, a reverse acting pawl pivoted to said support and including a thrust member normally engaging said ratchet wheel whereby rotational



movement of said ratchet wheel is transmitted to said support in the same direction, a cam member formed on said pawl, an abutment positioned in the path of movement of said cam member and adapted upon contact therewith to withdraw said thrust member from said ratchet wheel, a feed pipe carried by said support, the lower end of said feed pipe being adapted to successively register with the filling openings of said bottles on the platform during rotational movement of said support in the direction mentioned, and means synchronized with the movement of the conveyor for periodically delivering a small quantity of a solid to said feed pipe.

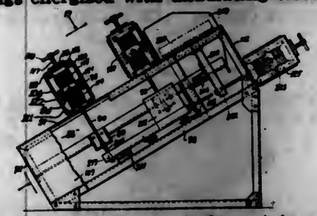
2,109,392
HYDRAULICALLY CONTROLLED DIRT MOVING MACHINE
Charles Le Bleu, Los Angeles, Calif.
Application May 21, 1935, Serial No. 22,529
7 Claims. (Cl. 37—144)

1. A hydraulically operated dirt moving machine comprising a tractor, separate track laying units at opposite sides thereof, a dirt moving member disposed transversely of the front of the tractor, a frame member articulately connecting the dirt moving member with the tractor for raising, lowering, and tilting movement, vertical links pivotally connected with said track laying units at their lower ends, operating levers pivotally mounted on said links of the separate track laying units and connected at their forward ends to said frame, a rigid upright carried by each of said track laying units, a piston rod extending longitudinally of each track laying unit and pivotally connected to the upright at the rear thereof and to the upper end of one of said vertical links, a piston carried on the piston rod at a point intermediate its ends, a cylinder mounted on each of said pistons for longitudinal reciprocating motion with relation thereto, and an operative connection between said cylinder and an arm of the levers carrying the frame of the dirt moving member whereby longitudinal shifting of the cylinder with relation to its piston will swing the lever.

2,109,393
TRAILBUILDER, BULLDOZER, AND THE LIKE
Charles Le Bleu, Los Angeles, Calif.
Application June 4, 1935, Serial No. 24,963
8 Claims. (Cl. 37—108)

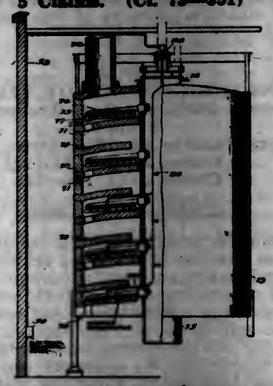
1. The combination in a device of the character disclosed; a tractor; a pair of spaced apart side frames carrying at one end an earth scraping element; said element being provided with a forwardly projecting side cutter and open at its other end for passage of material, means for swingingly connecting said side frames to said tractor; means for swinging said side frames to raise and lower said earth scraping element, and means mounted on the device and operable to cause earth to be discharged upon the ground outside the path of the line of travel to the side of the device.

2,109,394
ROTARY SCRAPER
Harry M. Livingston, Rainier, Wash.
Application April 11, 1936, Serial No. 73,948
4 Claims. (Cl. 37—140)



1. In a rotary scraper, the combination with a frame; a substantially rectangular scoop closed on its end, bottom, and rear sides but open on its top and front sides; trunnion connection between the frame and the scoop; a transverse bridge secured to the center of the upper edges of the end sides of the scoop and braced to the bottom and rear sides of the scoop; and a control beam mounted on the frame and releasably engaging the bridge, whereby the rotation of the scoop is prevented.

2,109,395
MECHANICAL MOVEMENT APPLICABLE TO MATERIAL SCREENING APPARATUS
George E. Markley, Cleveland Heights, Ohio
Application November 25, 1933, Serial No. 699,691
43 Claims. (Cl. 209—326)



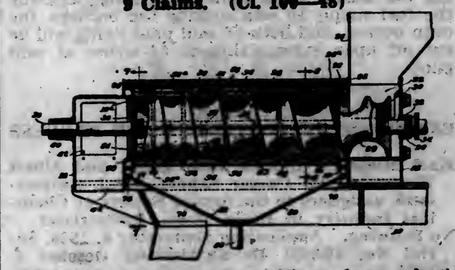
27. In a vibratory apparatus, a supporting frame, a load element supported on the frame

to move in a plurality of directions, means comprising a plurality of electro-magnets having movable portions arranged to transmit their movements to the load element and having windings energized with undulating electric cur-

rents for moving the load element in said plurality of directions with pulsating movements in time spaced relation to cause a portion of the load element to move in a closed path of movement, and means for neutralizing kinetic energy of the moving load element.

2,109,396
THERMOCOUPLE SYSTEM
William K. McCoy, Pittsburgh, Pa., assignor to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 3, 1937, Serial No. 146,292
5 Claims. (Cl. 72—351)

2. A thermocouple system for measuring temperatures at a plurality of points in a rotary apparatus, said system comprising a set of thermocouples mounted on the rotary apparatus, a stationary registering instrument, a plurality of conducting rings mounted in a fixed relation to the rotary apparatus and electrically connected to the thermocouples, a plurality of stationary contact elements engaging the rings and in electrical connection with the registering instrument, stationary means for mounting the contact elements and an enclosing housing for said rings, contact elements and mounting means and a body of oil contained in the housing and surrounding the contact elements and rings.

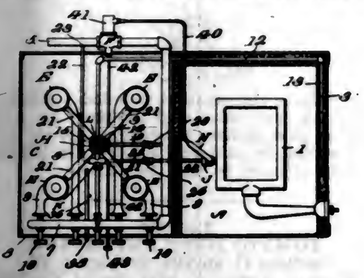


2,109,397
CLOSURE FOR COLLAPSIBLE TUBES AND CONTAINERS
Frank McLaughlin, Toronto, Ontario, Canada, assignor, by mesne assignments, to Douglas Henderson, Toronto, Ontario, Canada
Application June 13, 1935, Serial No. 26,445
4 Claims. (Cl. 221—69)

1. A collapsible tube or container having a neck portion provided with a central opening in the top thereof; an annular shoulder formed at the lower end of said neck having an upwardly directed annular recess; a valve for said central opening; an annular plunger movable in the neck

portion above the annular shoulder; spaced legs connecting said valve and plunger; an annular flange on said plunger extending into the recess; and a spring in said recess normally tending to move the plunger to seat the valve.

2,109,398
TOMATO JUICE EXTRACTOR
Willard C. McNitt, Winnetka, Ill.
Application August 7, 1934, Serial No. 738,834
9 Claims. (Cl. 100—48)



7. A juice extractor comprising a base, a horizontal housing positioned thereon, a pair of bearing members forming the end portions of said housing, a spiral screw member axially mounted in said housing, a cylindrical screen mounted in said housing enclosing said screw member and means in the form of a protruding annulus associated with said screw member providing a constant size opening with said screen whereby the pressure to which material passing through is subjected is regulated, and means associated with the screw for regulating the speed with which material passes through said machine.

2,109,399
LIGHTER ARRANGEMENT FOR GAS RANGES
Benjamin Edward Meacham and Edward M. Meacham, Lorain, Ohio, assignors to American Stove Company, St. Louis, Mo., a corporation of New Jersey
Application April 14, 1936, Serial No. 74,383
4 Claims. (Cl. 158—115)

1. In combination with a stove, a plurality of cooking top burners, an oven burner, a cooking top pilot burner provided with means to ignite fuel flowing from any one of the cooking top burners, a fuel supply pipe leading to all of said burners including said pilot light burner, means including an oven pilot light burner positioned to ignite fuel flowing from the oven burner, a second fuel supply pipe leading to said pilot light burner, thermostatic valve means in the first mentioned fuel supply pipe and responsive to the heat of said oven pilot light burner, said valve means controlling the flow of fuel to said cooking top and oven burners and said cooking top pilot light burner and being operable to permit fuel flow only as long as said oven pilot light burner is burning and to close all said fuel flow upon failure of said oven pilot light burner, thermostatic valve means in the second fuel supply pipe

leading to said oven burner pilot light and responsive to the heat of the cooking top burner pilot light and operable to permit fuel flow to the oven burner pilot light only when said cook-

ing top burner pilot light is burning, whereby the fuel supply to said cooking top burners, the oven burner, and both of said pilot lights will be cut off upon extinguishment of either of said pilots.

2,109,400

ESTERS OF TESTOSTERONE AND PROCESS OF MAKING SAME

Karl Miescher, Riehen, near Basel, and Albert Wettstein and Caesar Scholz, Basel, Switzerland, assignors to the firm of Society of Chemical Industry in Basle, Basel, Switzerland

No Drawing. Application September 8, 1936, Serial No. 99,856. In Switzerland October 5, 1935

16 Claims. (Cl. 260—106)

1. The 3 - keto-cyclopentanopolyhydrophenanthrenes containing in 17-position the group

wherein R is a member of the group consisting of hydrogen and a lower aliphatic hydrocarbon radical, and Ac stands for an unsubstituted monocarboxylic acid radical containing more than two carbon atoms.

2,109,401

AMINOALKYL-SULPHONIC ACIDS AND PROCESS OF PREPARING THEM

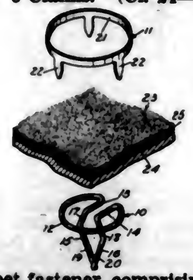
Otto Nicodemus and Walter Schmidt, Frankfort-on-the-Main-Hochst, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application October 23, 1935, Serial No. 46,440. In Germany October 26, 1934

4 Claims. (Cl. 260—127)

4. The process of preparing aminoalkyl-sulphonic acids which comprises heating alkali metal salts of dialkylether-disulphonic acids with nitrogen-containing bases which have at least one replaceable hydrogen atom attached to the nitrogen atom selected from the group consisting of compounds of the general formula

wherein R_1 stands for a member of the group consisting of H, alkyl, aralkyl and aryl and R_2 stands for a member of the group consisting of H, OH, NH_2, NH-alkyl, NH-aryl, alkyl, aralkyl and aryl.



2,109,402

CARPET FASTENER

Bion C. Place, Detroit, Mich., assignor of one-half to George E. Gagnier, Detroit, Mich.

Application May 12, 1934, Serial No. 725,365

6 Claims. (Cl. 24—213)

1. A carpet fastener, comprising in its entirety, first, a snap fastener stud part consisting of a flat head and a resilient shank including only two legs arranged to pass each other like the arms of scissors, said legs presenting edge surfaces that diverge adjacent the head and then converge, and second, a stud securing part comprising a ring of a substantially greater diameter than the diameter of said head, said ring having a plurality of tongues formed to penetrate the body of the carpet and embrace portions of the head of said stud part.

2,109,403

MEANS FOR GUIDING TOY VEHICLES

Louis Roussy, Paris, and René Trubert, Viroflay, France

Application January 22, 1936, Serial No. 60,300

In France January 24, 1935

3 Claims. (Cl. 104—60)

1. Means for guiding and for supplying current to an electrically propelled vehicle comprising in combination an electrical conducting track, electrical conducting curbs on both edges of said track, insulating means interposed between said track and said curbs, and an electrical conducting bumper for contacting said curbs mounted on said vehicle and in electrical connection to one pole of the electric propelling motor of said vehicle and also in operating connection with the steering mechanism of said vehicle, means for electrically connecting the other pole of said electric propelling motor with said electrical conducting track, a second electrical conducting bumper so mounted on said vehicle as to guide all similar vehicles coming in contact therewith to one side of said vehicle, electrical conducting strips mounted on the side of said vehicle, said second bumper and said conducting strips being in electrical connection with said first bumper in order to impart electrical current to one pole of the propulsion means of said passing similar vehicle which has been guided away from one of said curbs by said second bumper.

2,109,404

PAD HOLDER

Vernon B. Trevellyan, Chicago, Ill., assignor to Cleanser Products, Inc., Chicago, Ill., a corporation of Illinois

Application July 13, 1936, Serial No. 90,352

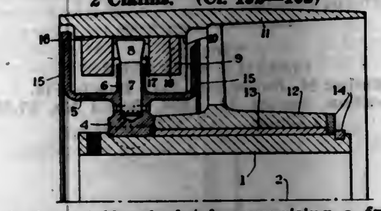
1 Claim. (Cl. 15—143)

A pad holder formed of spring metal and having two substantially parallel arms between which

a pad may be held by the initial spring action of the arms, the metal between the arms forming a base integral with the arms and upon which the

holder may stand when not in use, and also providing a sump for catching drip from a pad held between the arms of the holder.

2,109,405



FRICTION CLUTCH

Karl Johan Wersäll, Alsten, Sweden

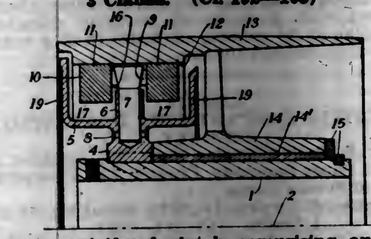
Application August 4, 1937, Serial No. 157,428

In Sweden December 31, 1934

2 Claims. (Cl. 192—105)

1. A centrifugal clutch comprising a friction track, a driving member, studs carried by said driving member, shoes adapted to be driven by said studs and to engage frictionally with said track under centrifugal action, each of said shoes having an elongated recess for the reception of a stud and a contact surface for driving engagement by the stud, said contact surface being so inclined to the radial center line of the shoe that a line perpendicular to and passing through the center of said surface intersects said radial center line at a point adjacent to but beyond said friction track.

2,109,406



FRICTION CLUTCH

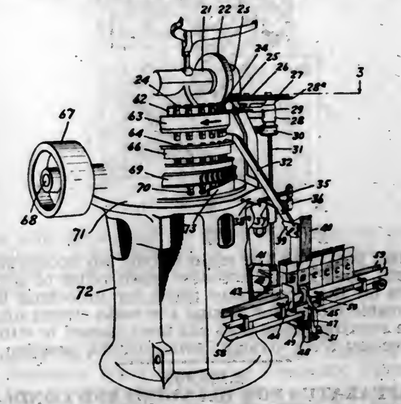
Karl Johan Wersäll, Alsten, Sweden

Application August 4, 1937, Serial No. 157,429

In Sweden December 28, 1934

3 Claims. (Cl. 192—105)

1. A centrifugal clutch comprising an outer friction track member, an inner driving drum, studs located within and carried by said driving member to engage with and drive exchangeable friction shoes which are adapted to engage drivingly with said track under centrifugal action and which are laterally turnable about said studs, a radially projecting peripheral rib on said driving drum to support said studs, and a stop on each shoe adapted to engage with said rib to limit the radial movement of said shoes independently of the degree to which the shoes extend radially inwards beyond the periphery of the rib, said driving drum having accommodation on either side of said rib for depending shoe portions of various sizes.



2,109,407

TABLET PACKAGING MACHINE

Charles J. Westin, Philadelphia, Pa., assignor to F. J. Stokes Machine Company, Philadelphia, Pa., a corporation of Pennsylvania

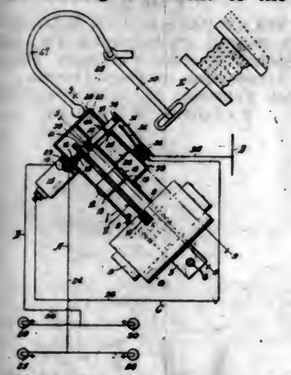
Application February 27, 1936, Serial No. 65,952

9 Claims. (Cl. 107—4)

1. In a tablet-packaging machine, a rotary head having a plurality of mold-cavities therein and bearing a plurality of punches co-operating with said mold-cavities for the compression of numbers of tablets, a take-off co-operating with said head to receive tablets on said head and convey them to a sloping chute which conducts the tablets to a funnel, a belt conveyor for conveying a plurality of containers beneath said funnel to receive tablets therefrom, a stop mounted adjacent said conveyor for stopping said containers so that one of them is aligned with said funnel, a clamp for clamping said aligned containers beneath said funnel, an index finger having a portion movable adjacent said chute so as to interrupt the passage of tablets along said chute, a cam-shaft having cams thereon for actuating said stop and said clamp and said index-finger, a pivotally mounted housing, and a star wheel mounted on said housing to mesh with said punches and to drive said cam-shaft.

2,109,408

VEHICLE DIRECTION SIGNAL



Sidney Fenner Adam, St. Louis, Mo., assignor of one-third to Robert Gordon Adam and one-third to Florence Smith Adam, both of St. Louis, Mo.

Application January 12, 1937, Serial No. 120,208

6 Claims. (Cl. 177—339)

1. In a vehicle direction signal, in combination, a vehicle including a steering wheel post, a main circuit, a left hand turn signal operating circuit, a right hand turn signal operating circuit, a turn indicating lamp on the vehicle in each turn signal operating circuit, a rotatably driven member peripherally contacting the steering wheel post and directly responsive to turning movements of the steering wheel post in either direction, a protuberance on the rotatably driven member, movable means actuated by the protuberance on said rotatably driven member for opening the main circuit when the steering wheel post is in straight away driving position only,

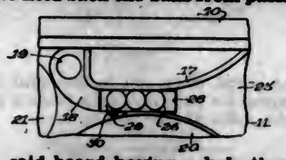
means for locking the movable means to hold the main circuit open, a switch member responsive to movement of the rotatably driven member to connect the turn signal operating circuit indicative of the turning movement of the steering

wheel post with the main circuit, an accelerator pedal, and means actuated upon relief of pressure on the accelerator pedal for unlocking the movable means for closing the main circuit after the steering wheel post has been turned in either direction from straight away driving position.

2,109,409
APPARATUS FOR BLENDING AND CONDITIONING TOBACCO

Hermann S. Bogaty, Philadelphia, Pa., assignor to Procter & Schwartz, Incorporated, Philadelphia, Pa., a corporation of Pennsylvania

Application August 3, 1933, Serial No. 683,529
5 Claims. (Cl. 131—55)



1. A tobacco-conditioning apparatus comprising a relatively long primary compartment and a relatively short secondary compartment through which the material passes successively, means for supporting the material in transit in a compacted moisture pervious mass horizontally disposed over substantially the entire width of the compartments, means for initially supplying a conditioning medium to the primary compartment under pressure below said mass for a single passage upwardly through the material under its own pressure to an exhaust space therein, means affording communication between the exhaust space of the primary compartment and the under-mass portion of the secondary compartment, and means for circulating the conditioning medium in the secondary compartment through the material therein to draw the single passage conditioning medium into the secondary compartment from the exhaust space of the primary compartment.

2,109,410
GAME

Herbert G. Breitenstein, Chicago, Ill., assignor to Raymond T. Moloney, Chicago, Ill.

Original application September 27, 1934, Serial No. 745,745, now Patent No. 2,068,258, dated July 27, 1937. Divided and this application March 24, 1937, Serial No. 132,790
10 Claims. (Cl. 273—121)

4. A game comprising a board inclined from the horizontal and having an inclined passage formed thereon, means for projecting balls over the board, said balls adapted to enter the passage, a bell crank switch mounted for horizontal turning movement above the board and adjacent the passage to hold back the balls from passing there-

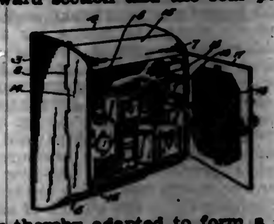
through, said board having a hole therethrough adapted to permit a subsequently projected ball to fall therethrough, and a device under the board actuated by the ball dropping through said hole, said device having connections for moving the switch to allow a ball to pass the switch to roll through the passage.

2,109,411
LIPSTICK SPREADER

Esther M. Buttschau, Vero Beach, Fla.

Application August 21, 1936, Serial No. 97,259
1 Claim. (Cl. 132—78.5)

A device of the character set forth comprising a casing having a chamber, a holder received in the chamber and having a slot, a follower slidable in said holder, a finger piece formed on said follower and extending through the slot, a spreader mounted in said holder and having one end secured in the follower, and including a body provided with a series of partially detached wafer-like parts capable of being readily separated when needed for use.



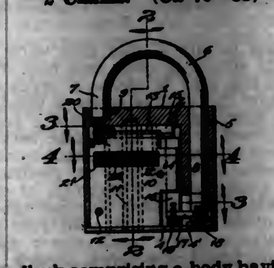
2,109,412
MULTIPLE COMPARTMENT DISPENSING CABINET

Wesley S. Corbin, Ridley Park, Pa., assignor to Scott Paper Company, Chester, Pa., a corporation of Pennsylvania

Application December 14, 1935, Serial No. 54,496
1 Claim. (Cl. 312—153)

A unitary combined towel dispensing and utility cabinet comprising a rear casing section having a back panel and upper, side and bottom walls extending forwardly from the respective edges of said panel to provide a compartment with an open front, said rear section being adapted for reception of a towel pack and said bottom wall having an aperture through which said towels may be individually withdrawn from the cabinet, a forward casing section hinged to the front edge of one of the side walls of said rear section comprising a rear panel of a size to close the open

front of said rear section and provided with a smooth, continuous rear surface, and upper, side and bottom walls extending forwardly from said rear panel and forming continuations of the upper, side and bottom walls of said rear section, said forward section and the rear panel there-

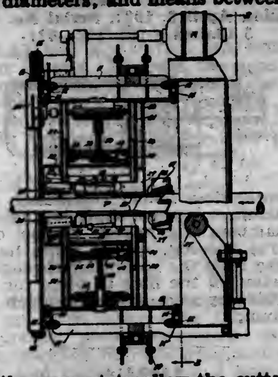


of being thereby adapted to form a closure for the front of said rear section and presenting an uninterrupted smooth surface on the rear of the front compartment, and a door hinged to the forward edge of a wall of said forward section, the hinge for the door being on a wall opposite the hinge between the forward and rear sections.

2,109,413
PADLOCK

James A. Cox, Santa Fe, N. Mex.

Application March 1, 1937, Serial No. 128,537
2 Claims. (Cl. 70—38)



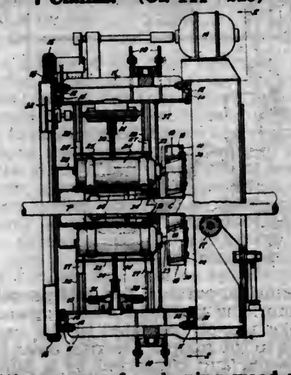
1. A padlock comprising a body having a chamber and a passage communicating with said chamber and opening outwardly through a face of the body, said body having a recess, a shackle including leg portions, with one of said leg portions entering the chamber by way of said passage and the other leg portion adapted to be moved into and out of the recess by sliding and rotating said shackle, a member slidable in the chamber, means connecting said member to the shackle, spring means acting on said shackle and member, a support in said chamber and having a key passage to receive a key, a locking bolt slidable in said chamber to engage said member for securing the shackle in a locked position and having a key opening, a spring acting on said locking bolt, and tumblers carried by said support and connected with the locking bolt.

2,109,414
CUTTER FOR POLE SHAPING MACHINES

August M. Deiters, Atlanta, and Elam R. Gillon, East Point, Ga., assignors to Southern Wood Preserving Company, Atlanta, Ga., a corporation of Georgia

Application January 11, 1937, Serial No. 120,104
13 Claims. (Cl. 142—54)

1. In a pole trimming machine having a rotatable casing mounted for universal and floating movement and means to guide a pole longitudinally through the machine imparting movement to the casing in response to sweeps and irregularities in the pole, a rotatable cutter having a support mounted for slidable radial adjustment within the casing and connected to rotate bodily therewith around the pole; positively operated means for adjusting the cutter to trim poles of different diameters; and means between the cut-



ter and the support to allow the cutter to move radially independently of its adjustment as it engages high and low places on the surface of the pole.

2,109,415
POLE SHAPING CUTTER

August M. Deiters, Atlanta, Ga., assignor to Southern Wood Preserving Company, Atlanta, Ga., a corporation of Georgia

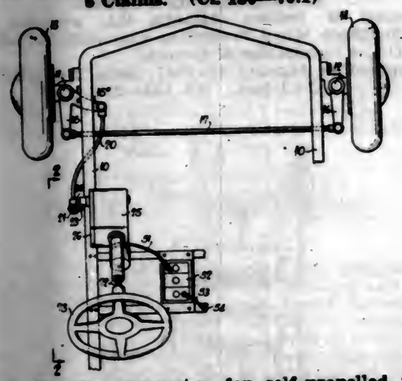
Application January 11, 1937, Serial No. 120,105
7 Claims. (Cl. 144—218)

3. Cutting means for shaping wood poles and the like comprising, in combination, a rotatable cutter head carrying cutter blades and adapted to rotate bodily relative to the pole while the pole moves relatively longitudinally of and parallel with the axis of the head; and eccentrically and angularly arranged saw segments associated with the cutter head to produce a kerf around the pole and sever the wood fibres ahead of the blades.

2,109,416
ROSIN FOR VIOLIN BOWS, ETC.

Emanuel Dziemczyk, Breslau-Goldschmieden, Germany

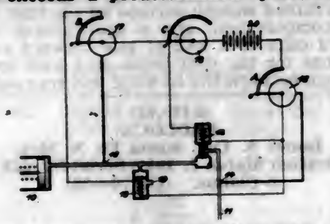
No Drawing. Application April 8, 1937, Serial No. 135,817. In Germany March 12, 1936
2 Claims. (Cl. 106—7.5)



1. Rosin for violin bows or the like, comprising a compact unitary mass composed of individual mutually adhering particles of powdered colophony.

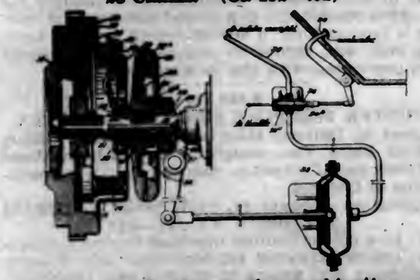
2,109,417
DENTAL FLOSS HOLDER
Catherine Belling Elcan, Hot Springs National Park, Ark.
Application April 3, 1937, Serial No. 134,892
5 Claims. (Cl. 132—92)

1. A dental floss holder comprising a casing having chambers, a spool shaft journaled in one of the chambers and having a spool of dental floss secured thereon, spaced tubes having the floss passing from the spool therethrough to present a portion of the floss in place for use, and means carried by said casing on which the floss may be wound.



2,109,418
POWER STEERING APPARATUS FOR VEHICLES
William W. Fuller, Norfolk, Va., assignor to Hermoine Fuller, Norfolk, Va.
Application March 6, 1937, Serial No. 129,424
6 Claims. (Cl. 180—79.1)

1. Steering apparatus for self-propelled vehicles comprising manual steering means, a casing, a yoke slidably mounted in the casing and responsive to the manual steering means, a shaft in said casing and connected by a plurality of links to the wheels of the vehicle for steering the same, an arm on said shaft, a pivotal connection between the yoke and the arm, a member mounted on the steering means and movable into engagement with the yoke to steer the vehicle, and means in the casing controlled by the manual steering means for counter-acting the resistance offered by the wheels of the vehicle when the member is moved into contact with said yoke to steer said wheels.

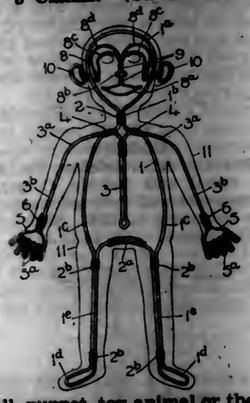


2,109,419
ELECTRICALLY ACTUATED DEVICE FOR INCREASING THE BRAKING ACTION
Hans Gallusser, Geneva, Switzerland
Application April 22, 1937, Serial No. 138,469
In Germany March 30, 1937
9 Claims. (Cl. 303—21)

1. In a compressed air braking system for vehicles adapted to apply greater braking action at higher speeds of the vehicle, a source of compressed air, a brake motor, an air supply pipe connecting said compressed air source with the brake motor, a normally open valve in said pipe between the air source and brake motor, a second valve, normally closed, connected to said pipe between said source and said brake motor and to the atmosphere, electrical means for actuating each of said valves, electrical circuits in which said electrical valve actuating means are connected, a source of electricity connected in said circuits, a pressure responsive device connected to said air supply pipe and having an electrical contact device connected in both of said circuits, to close said circuits when the pressure in said pipe reaches a predetermined pressure, vehicle speed responsive means having an electrical contact device connected in the circuit of said first-mentioned valve to open said circuit when the speed exceeds a predetermined speed, whereby

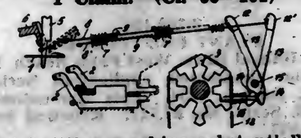
the actuating means of said first valve is controlled by its circuit to close said pipe when the pressure in the pipe is above a predetermined pressure while the vehicle speed is below a predetermined speed, a second pressure responsive device connected to said supply pipe between the first valve and said brake motor, said second pressure responsive device having an electrical contact device connected in the circuit of said second valve actuating means to close the second circuit when the pressure in said pipe between the first valve and the brake motor exceeds a predetermined pressure which is greater than the circuit closing pressure of the first-mentioned pressure responsive device, whereby said second valve is opened and allows discharge of air from said pipe and motor to atmosphere when the pressure in said pipe exceeds a predetermined pressure while the speed is below a predetermined speed.

2,109,420
CLUTCH CONTROL APPARATUS
Charles O. Guernsey, Yeadon, Pa.
Application July 16, 1932, Serial No. 622,948
23 Claims. (Cl. 192—.01)



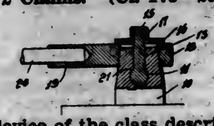
1. In a clutch control, the combination with a clutch including driving and driven elements, and means to engage said elements at a predetermined speed of the driving element, of means responsive to variations in the speed of one of the elements for controlling the rate of engagement of the elements by said engaging means.

2,109,421
MOLDING OF CONCRETE PIPES AND THE LIKE
Charles Cyril Halkyard, Melbourne, Australia, assignor to Hume Pipe Company (Australia) Limited, Melbourne, Australia
Application May 26, 1934, Serial No. 727,817
In Australia June 15, 1933
2 Claims. (Cl. 25—30)



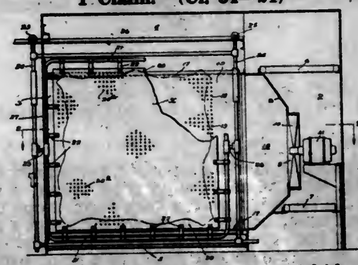
2. A device of the character described, comprising a rotary mold, a supporting frame, means on said frame for supporting and rotating said mold about a horizontal axis to centrifugally apply a concrete mixture to the interior thereof, a rotary pressing and leveling member extending longitudinally through said mold, a support for said member positioned at each end of the mold, each support comprising a seat for rotatably accommodating the end portions of said member and provided with an open side for the introduction and removal of said member, and means for adjustably securing said supports to said frame.

2,109,422
DEFORMABLE FIGURE EMPLOYABLE FOR PRODUCTION OF ANIMATED CARTOON FILMS
Wilfrid Henry Haughton, Carshalton Beeches, England
Application October 17, 1936, Serial No. 106,238
In Great Britain November 2, 1935
3 Claims. (Cl. 46—156)



1. A doll, puppet, toy animal or the like for use in producing an animated cartoon film, comprising a skeleton foundation of soft wire or the like for the body and limbs, other soft wire or the like for the foundation of facial features of the head, a suitable padding for the skeleton foundation and a covering shaped to the desired form of the device to be constructed and enclosing the whole, whereby in addition to adjustment of the body and limbs, changes in facial expression can be manually obtained.

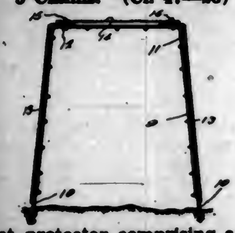
2,109,423
FLAT RIB KNITTING MACHINE
Woldemar Heinitz, Chemnitz, Germany, assignor to Schubert & Salzer Maschinenfabrik Aktiengesellschaft, Chemnitz, Germany
Application December 10, 1935, Serial No. 53,811
In Germany December 10, 1934
1 Claim. (Cl. 66—101)



A flat knitting machine substantially for the purpose set forth, comprising frame needles, a general presser, press instruments, wrap guides and a horizontally movable Jacquard roller acting upon said press instruments and upon said wrap guides.

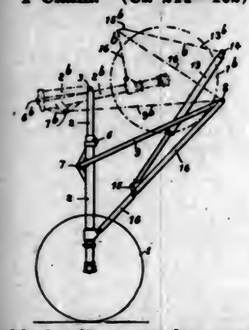
2,109,424
BATTERY TERMINAL AND POST
Harry A. Hess, Elcho, Wis., assignor of one-half to Ernest Foss, Elcho, Wis.
Application April 10, 1936, Serial No. 73,782
2 Claims. (Cl. 173—259)

2. In a device of the class described, a battery post having a recess formed therein and opening at the top and side thereof and provided with an enlarged base, an insert formed to fit said recess and to be mounted therein and provided with an enlarged base engaging the base of the recess to prevent vertical movement of the insert when in position, a cable socket mounted on said post, said insert having one edge in engagement with said socket to prevent lateral movement of the insert, a threaded member projecting from the top of said insert, and a nut engaging said threaded member and bearing against said socket to hold it on said post.



2,109,425
PROCESS OF DRYING LEATHER AND SIMILARLY TAUTLY STRETCHED UNITS
Alpheus O. Hurxthal, Philadelphia, Pa., assignor to Proctor & Schwartz, Incorporated, Philadelphia, Pa., a corporation of Pennsylvania
Application January 29, 1936, Serial No. 61,392
1 Claim. (Cl. 34—24)

The method of drying wet tanned hides prior to staking or other finishing treatment of the sur-



face of the hide, which consists in stretching a hide in all directions outwardly from the central area thereof toward the marginal edges of the hide, securing the edges of the stretched hide to a suitable support to resist subsequent shrinkage of the hide, and impinging jets of drying air against the surface of the hide at relatively closely spaced points simultaneously over substantially the entire area of said surface to effect uniform drying of the hide at substantially all points over the entire area of said surface simultaneously.

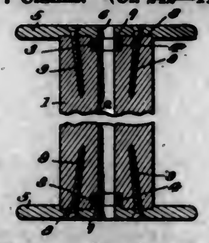
2,109,426
PLANT PROTECTOR
Henry Hansel King, West Palm Beach, Fla.
Refiled for abandoned application Serial No. 729,141, June 5, 1934. This application June 25, 1936, Serial No. 87,327. Renewed September 8, 1937
5 Claims. (Cl. 47—28)

1. A plant protector comprising a wire frame of substantially inverted U-shape, metal strips connected to the lower ends of the frame for penetrating the ground, metal strips connected to the upper corners of the frame, transparent sheets connected to the strips and covering the sides of the frame, and fabric covering the top of the frame and connected with the metal strips.

2,109,427
RETRACTABLE LANDING GEAR
René Lucien Lévy, Montrouge, France, assignor to Société d'Inventions Aéronautiques et Mécaniques S. I. A. M., Fribourg, Switzerland
Application January 9, 1936, Serial No. 58,396
In France January 12, 1935
1 Claim. (Cl. 244—102)

Retractable landing gear for aeroplanes comprising, for a wheel, a supporting frame, a fixed pivot pin for this frame, a knee joint at one point of this frame, a control bar pivoting about a fixed point of the aeroplane and pivoted, on the other hand, on the supporting frame at a point situated between the wheel and the point of articulation of said frame, an auxiliary leg pivoted, on the one hand, on the aeroplane and, on the other hand, on the supporting frame, and a lifting device pivoted, on the one hand, on the aeroplane and, on the other hand, on said auxiliary leg.

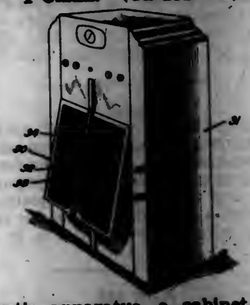
2,109,428
CORE FOR TRIMMING MOLDINGS
William John MacLeod, Lochmoor, Grosse Pointe Village, Mich., assignor to Beckstay Welt Company, Union City, Ind., a corporation of Indiana
Application May 17, 1935, Serial No. 22,162
6 Claims. (Cl. 154—43)



1. A core for trimming moldings and the like comprising a relatively thick strip of coarse textile material such as burlap impregnated with an adhesive composition having each of its opposite margins folded over the central zone of the strip to provide three plies, the several plies being consolidated into a unitary body by the adhesive, and the adhesive composition penetrating the several plies and coating the outer surfaces of the body.

2,109,429
SWIMMING DEVICE
Axel Sigfrid Malm, West Hartford, Conn.
Application November 20, 1936, Serial No. 111,939
1 Claim. (Cl. 9—21)

A swimming device comprising a relatively wide flat body substantially oval shape in outline and having rounded ends and straight sides, said body having a transversely disposed elongated hand receiving opening disposed therein on one side of the transverse center thereof, and a slot on the opposite side to receive the fingers of said hand, said opening and slot being disposed parallel with respect to each other and in close proximity to provide a gripping handle between the same.

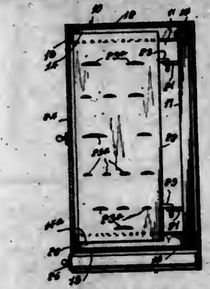


2,109,430
BOBBIN
George B. Markle, Jr., Hazleton, Pa., assignor to Freeland Spool and Bobbin Corp., Hazleton, Pa., a corporation of Pennsylvania
Application February 5, 1936, Serial No. 62,525
7 Claims. (Cl. 242—118)

4. A bobbin comprising a cylindrical body of the same diameter throughout its length having

a longitudinal bore extending therethrough enlarged at one end to form an annular recess to provide a seat, a bushing fitting snugly in said recess, a head arranged against each end of said body, one of the heads engaging the outer face of said bushing for securing said bushing within its seat, and fastening members extending through said heads into the ends of said body for securing said heads to said body and said bushing within said seat.

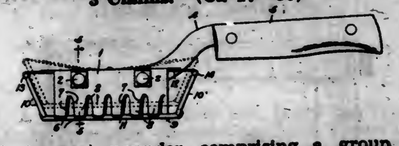
2,109,431
RADIO APPARATUS
Raymond W. Mcdonald, Washington, D. C., assignor of one-half to Cecil David Kaufmann, Washington, D. C.
Application May 8, 1937, Serial No. 141,550
1 Claim. (Cl. 181—31)



In acoustic apparatus, a cabinet having an opening in one wall thereof, a baffle board normally fitting in said opening hinged at one edge to said wall to swing outwardly with respect to said wall whereby said baffle board is altogether outside of said cabinet in all angular positions of swing, wings at the lateral edges of said baffle board and movable therewith, closing the angle between said baffle board and cabinet in any position of swing of said baffle board, forming extensions of the sounding box constituted by said cabinet, means for adjusting the baffle board at any desired angle, and a sound producer mounted on the inner side of said baffle board and movable therewith.

2,109,432
PLASTIC COMPOSITION
Stefan Morgenstern, Berlin-Charlottenburg, and Johann Eggert, Berlin, Germany, assignors to Deutsche Hydrierwerke Aktiengesellschaft, Berlin-Charlottenburg, Germany, a corporation of Germany
No Drawing. Application January 31, 1935, Serial No. 4,826. In Germany January 31, 1934
9 Claims. (Cl. 106—38)

1. A protein-containing material having incorporated therein as a plasticiser for said protein-containing material, a normal primary alcohol containing from twelve to eighteen carbon atoms.

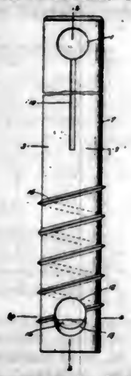


2,109,433
PICTURE STORAGE AND DISPLAY CABINET
Edward J. Merin, Omaha, Nebr.
Application August 4, 1936, Serial No. 94,228
1 Claim. (Cl. 312—181)

A device of the class described comprising in combination with a cabinet provided with swinging doors, guideways mounted in said cabinet on the top and bottom walls thereof in opposed relationship, said guideways being channel shaped and provided with inturned flanges spaced from each other and forming slots therebetween, supporting members slidably mounted in said guideways in vertical parallel relationship to support display racks, said supporting members having enlarged ends to prevent removal of the members through said slots, said supporting members being of a length to permit the lower enlarged portions to engage the bases of the lower guideways and the upper enlarged portions to engage

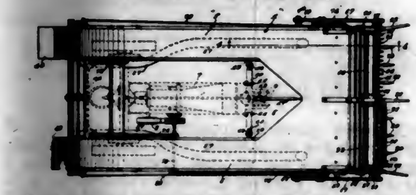
the flanges of the upper guideways, the thickness of said enlarged portions being substantially less than the height of said guideways to provide a space between the enlarged portions and the tops of the guideways, and said guideways having upturned end portions at their outer open ends forming spaces between said upturned end portions and the tops of said guideways greater than the thickness of the enlarged portions to permit said supporting members to be lifted and removed from said guideways.

2,109,434
STEAK POUNDER
William J. Oliver, Los Angeles, Calif.
Application March 31, 1937, Serial No. 134,164
3 Claims. (Cl. 17—30)



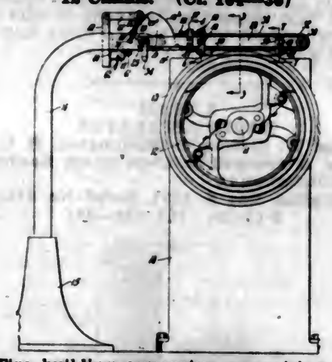
1. A meat pounder comprising a group of blades arranged in parallel and spaced relation, a handle connected to said group of blades, a meat engaging grating movable relative to said blades and between the latter, and spring means connecting the grating to the groups of blades, said spring means hingedly connected with one end of the grating and detachably and hingedly connected to the other end of the grating.

2,109,435
TIMBER BLASTING DEVICE
Leonard H. Sawyer, Royal, Nebr.
Application March 23, 1937, Serial No. 132,628
1 Claim. (Cl. 102—6)



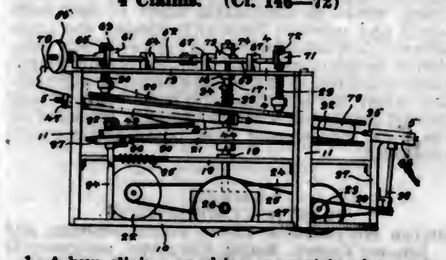
A blasting device of the class described comprising an elongated member of circular shape in cross section and having a centrally arranged bore extending from its inner end to an intermediate point of the member and providing a powder receiving chamber, a spiral thread forming rib on the exterior circumference of said member, said rib being of V-shape in cross section and extending from the inner end of the member to an intermediate point thereof, the outer

end of the member having a transverse hole therein and the inner end having a single pair of diametrically opposite arranged holes therein communicating with the bore and slightly spaced from the inner end of the member, said holes extending in the same radial direction as the first-mentioned hole, whereby the first-mentioned hole acts as indicating means for the pair of holes as well as a handle receiving hole, a



plug closing the inner end of the member and having its inner end of wedge shape and the pair of holes each having its inner side walls sloping outwardly towards the inner end of the member and these sloping walls forming continuations of the sloping walls of the wedge-shaped part of the plug and said member having a passage therein leading into the closed end of the bore for receiving a fuse.

2,109,436
HARVESTER AND THRESHER
Victor Schowengerdt, Chamois, Mo.
Application November 20, 1936, Serial No. 111,927
8 Claims. (Cl. 56—21)

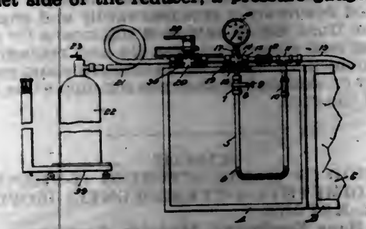


1. A combine comprising a housing including a front portion and upwardly and rearwardly extending side portions defining therebetween a tractor receiving space, means connecting the housing to a tractor, a cutting mechanism located in advance of the front portion of the housing and connected thereto for movement in an upward and downward direction with respect to the ground, manual means for adjusting the cutting mechanism relative to the ground, means for driving the cutting mechanism by power from the tractor, ground wheels for supporting the housing, threshing means located in the housing rearwardly of the cutting mechanism and driven by power from the tractor, grain separating means receiving threshed straw of the grain from the threshing mechanism to further separate any grain from the straw that may be left therein, exhaust means for receiving the straw from the separating means, a collecting bin carried by the housing, and means for conveying the grain separated from the straw to the collecting bin.

2,109,437
TIRE BUILDING APPARATUS
Florain J. Shook, Akron, Ohio, assignor to National Rubber Machinery Company, Akron, Ohio, a corporation of Ohio
Application January 4, 1934, Serial No. 705,204
12 Claims. (Cl. 164—36)

1. Tire building apparatus comprising a cutting tool consisting of a wire, means for supporting said tool in an inoperative position removed from a tire and in an operative position in engagement with a tire, and means for electrically heating said wire solely when it is in operative position.

2,109,438
BUN SLICING MACHINE
Robert R. Springer, Harrison, Ark., assignor of one-half to William W. McKinney, Harrison, Ark.
Application November 14, 1936, Serial No. 110,936
4 Claims. (Cl. 146—72)



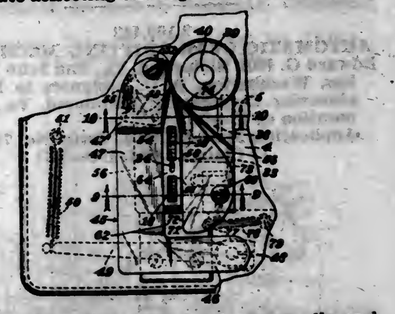
1. A bun slicing machine comprising bun gripping discs arranged in facing relation and differentiated in surface contour, means for mounting said discs on a common axis of rotation to provide parallel bun gripping surfaces through part of a revolution and divergent surfaces through the remainder of the revolution, and a knife intermediately positioned between said discs in the zone of the parallel surfaces, and means for reciprocating said knife radially of said discs.

2,109,439
CHLORINATOR
Clair V. Swearingen, Chattanooga, Tenn.
Application June 1, 1937, Serial No. 145,891
5 Claims. (Cl. 210—28)

1. In a chlorinator apparatus, a gas tank having a valved outlet for controlling discharge of gas therefrom, a four-way union having a branch connection with said valved outlet, a discharge tube leading from another branch of said union

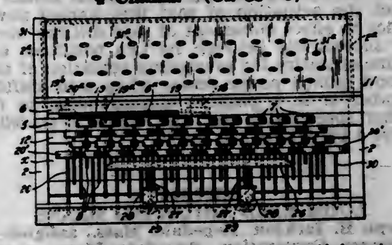
and having a reducer, a substantially U-shaped tube connected with another branch of said union and with the discharge tube, respectively, the connection between both tubes being located at the outlet side of the reducer, a pressure gauge con-

nected with the remaining branch of said union, a needle valve arranged in the branch leading from said tank, a calibrated dial supported next to the needle valve, and an indicator coacting with the needle valve and traversing said dial.



2,109,440
TRACTOR TRUCK LOADER
Chris J. Villerup, Glasgow, Mont.
Application November 20, 1936, Serial No. 111,913
2 Claims. (Cl. 214—130)

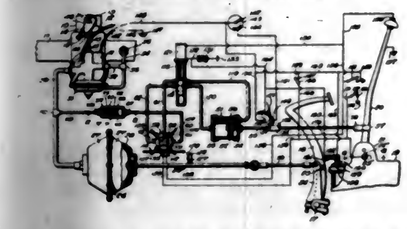
1. The combination with a tractor, of a supporting frame, a bucket pivotally mounted on the frame, means for rocking the bucket upwardly to dumping position, a box open at both ends hinged to the frame in position to receive the dumped contents of the bucket, hinged closures for the ends of the box, crank arms connected to the hinges of the closures, levers connected to the frame and to the crank arms and adapted to open the closures when the box is rocked upwardly at the forward end to form a trough for receiving the contents of the bucket, and hydraulic means for raising and lowering the box.



2,109,441
FOLDING AND PRESSING ATTACHMENT FOR SEWING MACHINES
Thomas A. Anderson, Hartwell, Ga., assignor to The Patent Button Company, Waterbury, Conn., a corporation of Connecticut
Application July 22, 1936, Serial No. 92,038
13 Claims. (Cl. 112—217)

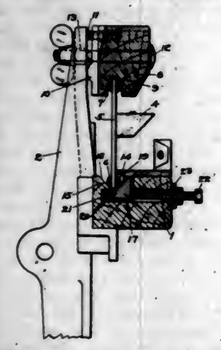
1. In combination with a sewing machine, a fabric folding and pressing mechanism secured to the sewing machine to fold and press the marginal edges of the fabric as the latter leaves said machine including a worm mounted on the main drive shaft of the machine, a pinion and shaft operated by said worm, a roller on said shaft, a pivotal arm having a loosely mounted roller therein and cooperating with said first-mentioned roller, a presser foot, a bridge plate having an elevated portion beneath the presser foot, a guide plate cooperating with the presser foot and the said elevated portion, and the rear end of said guide plate deflecting one edge of the fabric down-

wardly and holding the other edge upwardly and the said edges pressed in this position as they pass from said presser foot and guide plate through said aforementioned rollers.



2,109,442
MEANS FOR TEACHING AND PRACTICING TYPEWRITING
Joseph Henry Brewajohn, Leicester, England, assignor to Imperial Typewriter Company Limited, Leicester, England, a British company
Application December 10, 1936, Serial No. 115,216
In Great Britain December 20, 1935
4 Claims. (Cl. 35—5)

1. A device for teaching and practicing typewriting comprising, in combination, a frame including side members and at least one cross member, the upper edges of said side members being inclined and grooved on the insides adjacent to the inclined edges, a series of type levers pivotally mounted in the frame and each carrying at least two appropriate type characters arranged one above the other, a corresponding series of blank keys associated with the type levers and corresponding in number and arrangement with the conventional keyboard of a typewriter, an indicator in the form of a flat perforated member adapted to slide in the grooves in the side members of the frame, the perforations in the indicator being formed in rows to correspond with the keys and situated above the type characters on the type levers whereby when a lever is operated by striking the appropriate key a type character on said lever can be seen through the corresponding perforation in the indicator, means for locating the said indicator in position at its inner edge, spring means for normally holding the indicator against the locating means, in which position of the indicator the lower series of type characters on the type levers can be seen through the perforations when the keys are struck, and means for moving

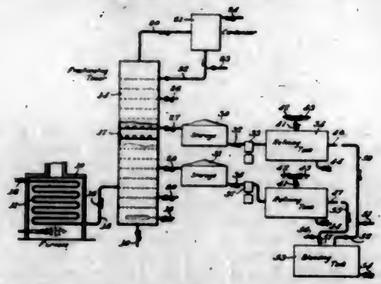


the indicator rearwards against the spring action so as to enable other characters on the type levers to be seen when the keys are struck.

2,109,443
AUTOMATIC GEAR SHIFTING MECHANISM
Edward G. Hill, Richmond, Va., and John X. Phillips, Washington, D. C., assignors to Hill Engineering Corporation, Richmond, Va., a corporation of Virginia
Application June 28, 1934, Serial No. 732,946
12 Claims. (Cl. 192—3.5)

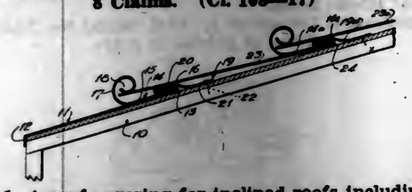
1. In a motor vehicle including a clutch and a transmission having a shifting member movable between two positions for transmitting power at different ratios for forward vehicle movement, a power device having a movable member connected to said shifting member, control means for said power device, a power device operative for disengaging the vehicle clutch, means operative upon each actuation of said last named power device for causing said control means to effect the actuation of said first named power device to effect movement of said shifting member successively between its two positions, and means operative for preventing actuation of said second named power device when said shifting member is in a position corresponding to the higher speed ratio and the vehicle is traveling above a predetermined speed.

2,109,444
LOOM REED ADJUSTING MEANS
Joseph B. Jackson, Hopedale, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine
Application January 8, 1937, Serial No. 119,648
5 Claims. (Cl. 139—188)



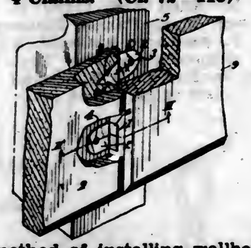
1. The combination of a loom lay having a longitudinal reed cut in its upper surface for receiving a reed rib, the back wall of said reed cut being inclined from the top thereof downwardly and forwardly, a reed having a rounded lower rib positioned in said reed cut and resting on said inclined wall, movable members positioned in recesses in the lay in front of said reed rib, the rear surface of each of said members being inclined downwardly and rearwardly and engaging the front side of said reed rib, means for adjusting said members forwardly and rearwardly to thereby move said reed rib forwardly and rearwardly on said wall, and means for supporting the top of the reed.

2,109,445
METHOD OF MANUFACTURING (1-PHENYL-2,3-DIMETHYL-5-PYRAZOLONYL)-ISOPENTYL-KETONE
Hans Kaufmann, Munster, Germany
No Drawing. Application May 7, 1936, Serial No. 78,519. In Germany May 7, 1935
3 Claims. (Cl. 260—45)



1. The method of preparing (1-phenyl-2,3-dimethyl-5-pyrazolonyl)-isopentyl ketone which consists in causing interaction between 1-phenyl-2,3-dimethyl-5-pyrazolone and diethylacetyl chloride in the presence of an agent capable of splitting off acid, and treating the resulting mixture with cool water, whereby the desired ketone separates.

2,109,446
REFINING OF MINERAL OILS
Marcus T. Kendall, Long Beach, Calif., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
Application January 13, 1934, Serial No. 706,482
2 Claims. (Cl. 196—40)

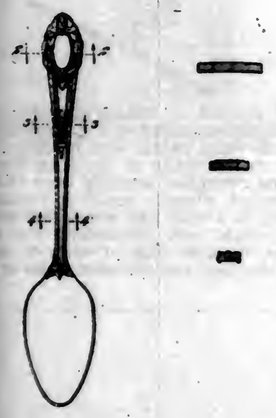


1. The process of preparing a marketable burning oil consisting essentially of hydrocarbons of the kerosene range boiling between substantially 360°–490° F., which comprises separating from a petroleum oil by non-cracking flash distillation a lighter kerosene distillate fraction boiling between substantially 360°–435° F. and a heavier kerosene distillate fraction boiling between substantially 435°–490° F., treating the lighter kerosene fraction with substantially 4 pounds of fuming sulphuric acid per barrel of oil followed by treating with substantially 9 pounds of recovered sulphuric acid per barrel of oil, treating the heavier kerosene fraction with substantially 20 pounds of fuming sulphuric acid per barrel of oil followed by treating with substantially 5 pounds of recovered sulphuric acid per barrel of oil, and blending the treated kerosene fractions to produce without redistillation a burning oil of the desired boiling range having a burn test at least equivalent to that produced by treating a mixture of the said kerosene fractions with substantially 18 pounds of fuming sulphuric acid per barrel of oil followed by substantially 7 pounds of recovered sulphuric acid per barrel of oil, whereby a substantial saving in the consumption of fuming sulphuric acid is effected.

2,109,447
ROOF STRUCTURE
Robert Edward Sadtler, Cincinnati, Ohio
Application September 24, 1937, Serial No. 165,513
8 Claims. (Cl. 108—17)

1. A roof covering for inclined roofs including a cover sheet extending longitudinally of the roof, a snow guard member having a flat portion resting on the upper part of said sheet, interlocking means formed on said sheet and snow guard at the upper edges thereof, a securing clip engaging said interlocking means and extending up the roof therefrom to have its upper end nailed to the roof, and a second cover sheet having its lower edge engagingly fitted under a portion of said snow guard and extending up the roof over said interlocking means and clip.

2,109,448
METHOD OF INSTALLING AND ASSEMBLING WALLBOARDS
Clifton Welch, Pensacola, Fla., assignor, by mesne assignments, to Jack A. Goodman, Columbus, Ohio
Application June 24, 1935, Serial No. 28,073
4 Claims. (Cl. 72—118)



1. The method of installing wallboard panels which comprises providing the longitudinal edges of the individual panels with metallic extensions disposed in the plane of the back walls of said panels and extending laterally from the marginal edges thereof, directly securing certain of said extensions to a wall joist along one side of each of said panels, and positioning the extensions along the opposite edge of each of said panels between the joist and the back walls of adjoining panels.

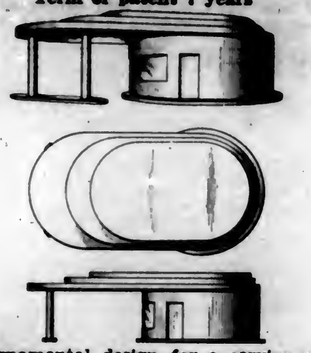
DESIGNS

FEBRUARY 22, 1938

108,532
DESIGN FOR A SPOON OR SIMILAR ARTICLE
Gresvenor N. Allen and Lloyd E. Rensegger, Oneida, and Mary Parker Fleming, Niagara Falls, N. Y., assignors to Oneida Ltd., Oneida, N. Y., a corporation of New York
Application January 5, 1938, Serial No. 74,100
Term of patent 14 years

The ornamental design for a spoon or similar article as shown and described.

108,533
DESIGN FOR A BROOCH OR THE LIKE
Nicholas Barbieri, Providence, R. I., assignor to Uncas Manufacturing Company, a corporation of Rhode Island
Application December 11, 1937, Serial No. 73,544
Term of patent 14 years



The ornamental design for a brooch or the like substantially as shown

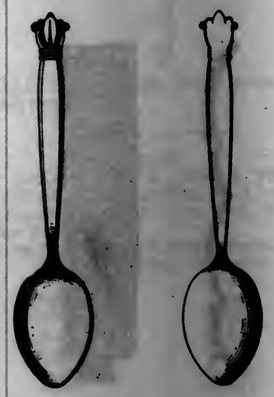
108,534
DESIGN FOR A BROOCH OR THE LIKE
Nicholas Barbieri, Providence, R. I., assignor to Uncas Manufacturing Company, a corporation of Rhode Island
Application December 13, 1937, Serial No. 73,568
Term of patent 14 years

The ornamental design for a brooch or the like substantially as shown.

108,535
DESIGN FOR A SERVICE STATION BUILDING OR THE LIKE
John F. Cheney, West Palm Beach, Fla.
Application December 16, 1936, Serial No. 66,571
Term of patent 7 years

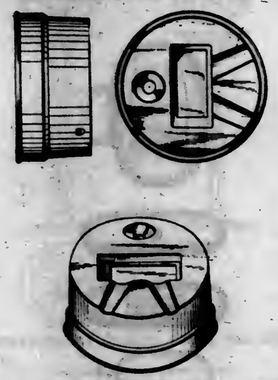
The ornamental design for a service station building or the like, as shown.

108,536
DESIGN FOR A BROOCH OR SIMILAR ARTICLE
Fulco di Verdura, New York, N. Y., assignor to Paul E. Flato, New York, N. Y.
Application January 6, 1938, Serial No. 74,113
Term of patent 3½ years



The ornamental design for a brooch or similar article, substantially as shown.

108,537
DESIGN FOR A BROOCH OR SIMILAR ARTICLE
Fulco di Verdura, New York, N. Y., assignor to Paul E. Flato, New York, N. Y.
Application January 6, 1938, Serial No. 74,114
Term of patent 3½ years



The ornamental design for a brooch or similar article, substantially as shown.

108,538
DESIGN FOR A SPOON OR ANALOGOUS ARTICLE
Alfred J. Flander, Trumbull, Conn.
Application November 17, 1937, Serial No. 72,971
Term of patent 7 years

The ornamental design for spoon or analogous article substantially as shown and described.

108,539
DESIGN FOR A COMBINED ASHTRAY AND CIGARETTE PACKAGE OPENER
Herbert Flohr, Cincinnati, Ohio, assignor of one-third to Otto Creutz and one-third to William G. Courtney, both of Cincinnati, Ohio
Application May 25, 1937, Serial No. 69,536
Term of patent 7 years

The ornamental design for a combined ash tray and cigarette package opener as shown.

108,540
DESIGN FOR A FINGER RING
Joseph Granat, San Francisco, Calif.
Application December 28, 1937, Serial No. 73,913
Term of patent 7 years

The ornamental design for a finger ring, substantially as shown.

108,541
DESIGN FOR A WEDDING RING
Joseph Granat, San Francisco, Calif.
Application December 28, 1937, Serial No. 73,914
Term of patent 7 years

The ornamental design for a wedding ring, substantially as shown.

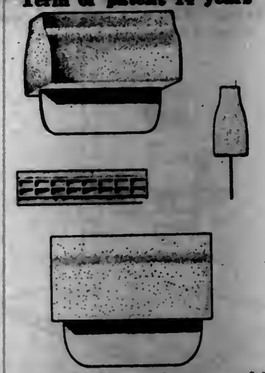
108,542
DESIGN FOR A HANDLE CASING FOR ELECTRIC CLIPPER OR THE LIKE
John A. Hanley, Noroton, Conn.
Application December 17, 1937, Serial No. 73,687
Term of patent 7 years

The ornamental design for a handle casing for electric clipper or the like, substantially as shown.

108,543
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
William W. Hobé, New York, N. Y.
Application December 30, 1937, Serial No. 73,965
Term of patent 3½ years

The ornamental design for a brooch pin or similar article, substantially as shown.

108,544
DESIGN FOR A BROOCH PIN OR SIMILAR ARTICLE
William W. Hobé, New York, N. Y.
Application December 30, 1937, Serial No. 73,966
Term of patent 3½ years



The ornamental design for a brooch pin or similar article, substantially as shown.

108,545
DESIGN FOR A BRACELET OR SIMILAR ARTICLE
William W. Hobé, New York, N. Y.
Application December 30, 1937, Serial No. 73,967
Term of patent 3½ years

The ornamental design for a bracelet or similar article, substantially as shown.

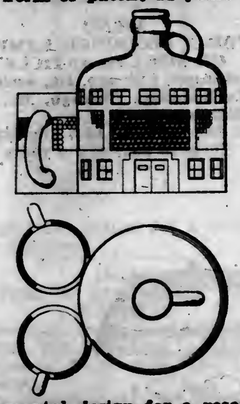
108,546
DESIGN FOR A COMBINED FROZEN CONFECTION AND HANDLE
Morris Lasow, Brooklyn, N. Y.
Application January 12, 1938, Serial No. 74,256
Term of patent 14 years

The ornamental design for a combined frozen confection and handle as shown.

108,547
DESIGN FOR A SHOE EYELET
Sahatiel G. Mandalian, North Attleboro, Mass.
Application August 19, 1937, Serial No. 71,187
Term of patent 7 years

The ornamental design for a shoe eyelet, as shown and described.

108,548
DESIGN FOR A PENCIL TIP
Joseph McNulty, Bergenfield, N. J., assignor to Eagle Pencil Company, New York, N. Y., a corporation of Delaware
Application December 10, 1937, Serial No. 73,519
Term of patent 14 years



The ornamental design for a pencil tip, substantially as shown.

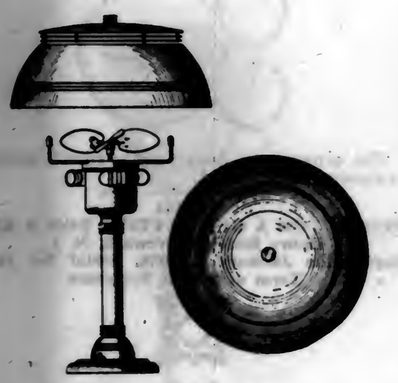
108,549
DESIGN FOR A SMOKING STAND
John K. Milton, Chicago, Ill.
Application December 14, 1937, Serial No. 73,617
Term of patent 14 years

The ornamental design for a smoking stand, as shown.

108,550
DESIGN FOR A RESORT BUILDING
Terrence R. Morgan, Vancouver, Wash.
Application December 21, 1937, Serial No. 73,786
Term of patent 14 years

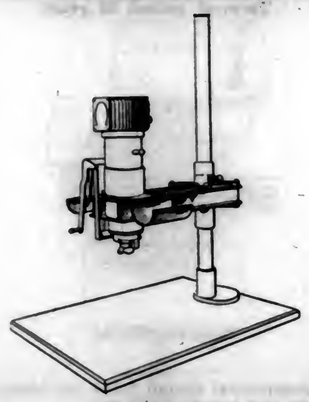
The ornamental design for a resort building, as shown and described.

108,551
DESIGN FOR A GEM SETTING FOR A RING
Henry Rufeisen, Newark, N. J.
Application January 3, 1938, Serial No. 74,061
Term of patent 3½ years



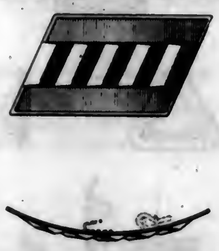
The ornamental design for a gem setting for a ring, as shown.

108,552
DESIGN FOR A COMBINED TOOTH BRUSH AND TUMBLER HOLDER
Roy S. Sanford, Oakville, Conn., assignor to The Anleyre Company, Incorporated, Oakville, Conn., a corporation of Connecticut
Application December 16, 1937, Serial No. 73,663
Term of patent 7 years



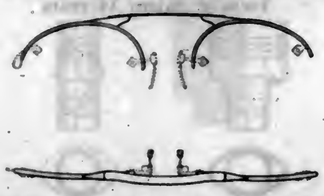
The ornamental design for a combined tooth brush and tumbler holder substantially as shown.

108,553
DESIGN FOR A COMBINED LAMP AND FAN OR SIMILAR ARTICLE
Ernest G. Shinner, Chicago, Ill., assignor to Air-O-Lite Corporation, Chicago, Ill., a corporation of Illinois
Application October 25, 1937, Serial No. 72,411
Term of patent 3½ years



The ornamental design for a combined lamp and fan or similar article as shown and described.

108,554
DESIGN FOR A PHOTOGRAPHIC ENLARGER
Rudolph Simmon, Long Island City, N. Y.
Application November 27, 1937, Serial No. 73,228
Term of patent 7 years



The ornamental design for a photographic enlarger substantially as shown.

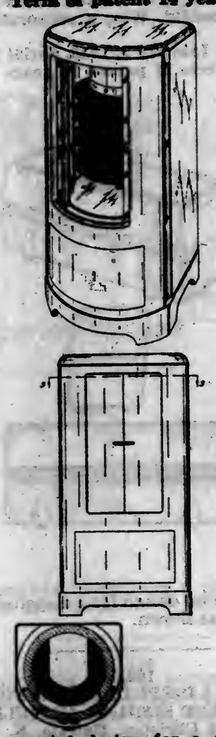
108,555
DESIGN FOR A BELT BUCKLE
Reuben Slote, Mount Vernon, N. Y., assignor to Slote & Klein, Inc., a corporation of New Jersey
Application November 13, 1937, Serial No. 72,856
Term of patent 3½ years

The ornamental design for a belt buckle, as shown.

108,556
DESIGN FOR AN OPHTHALMIC MOUNTING
Edward M. Splaine, Southbridge, Mass., assignor to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Application July 18, 1936, Serial No. 63,919
Term of patent 14 years

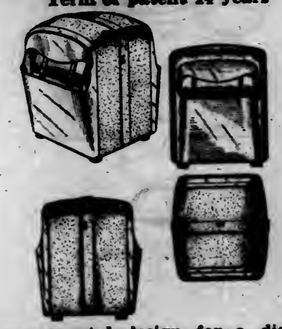
The ornamental design for an ophthalmic mounting substantially as shown and described.

108,557
DESIGN FOR A STEMMED GOBLET OR SIMILAR ARTICLE
Elmer Bell, Mount Pleasant, Pa., assignor to Bryce Brothers Company, Mount Pleasant, Pa., a corporation of Pennsylvania
Application January 17, 1938, Serial No. 74,354
Term of patent 14 years



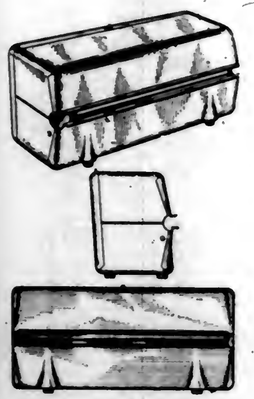
The ornamental design for a stemmed goblet or similar article substantially as shown and described.

108,558
DESIGN FOR A COMBINED DRINK STIRRER AND PICK
George W. Bergen, West Belmar, and Robert B. Dabney, Manasquan, N. J.
Application November 17, 1937, Serial No. 72,956
Term of patent 3½ years



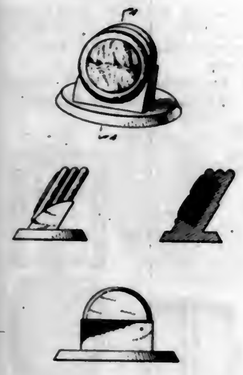
The ornamental design for a combined drink stirrer and pick, as shown.

108,559
DESIGN FOR A REFRIGERATOR
Alfred O. Boyce and George F. Appleby, St. Paul, Minn.
Application November 6, 1937, Serial No. 72,670
Term of patent 14 years



The ornamental design for a refrigerator as shown and described.

108,560
DESIGN FOR A DISPENSER FOR PAPER NAPKINS
Frank L. Broeren, Neenah, and Samuel N. Hope, Wauwatosa, Wis., assignors to Marathon Paper Mills Company, Rothschild, Wis., a corporation of Wisconsin
Application December 20, 1937, Serial No. 73,740
Term of patent 14 years



The ornamental design for a dispenser for paper napkins, as shown.

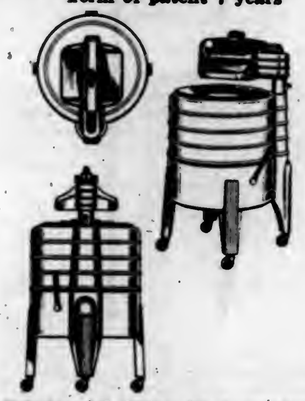
108,561
DESIGN FOR A DISPENSER FOR INTERFOLDED SHEETS
Frank L. Broeren, Neenah, Byron T. Hoffmaster, Menasha, and Archie S. Krueger, Green Bay, Wis., assignors to Marathon Paper Mills Company, Rothschild, Wis., a corporation of Wisconsin
Application January 3, 1938, Serial No. 74,044
Term of patent 14 years

The ornamental design for a dispenser for interfolded sheets, as shown.

108,562
DESIGN FOR A DISPLAY STAND FOR JEWELRY AND SIMILAR ARTICLE
Rudolf Christen, Buffalo, N. Y.
Application January 29, 1937, Serial No. 67,336
Term of patent 3½ years

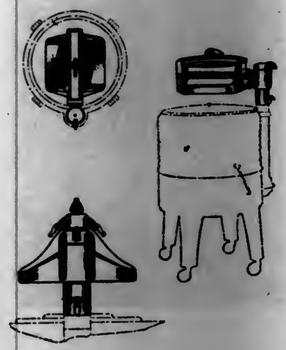
The ornamental design for a display stand for jewelry and similar article, as shown.

108,563
DESIGN FOR A REDINGOTE
Elizabeth M. Ciccone, New York, N. Y.
Application December 16, 1937, Serial No. 73,649
Term of patent 3½ years



The ornamental design for a redingote substantially as shown.

108,564
DESIGN FOR A REDINGOTE
Elizabeth M. Ciccone, New York, N. Y.
Application December 22, 1937, Serial No. 73,792
Term of patent 3½ years

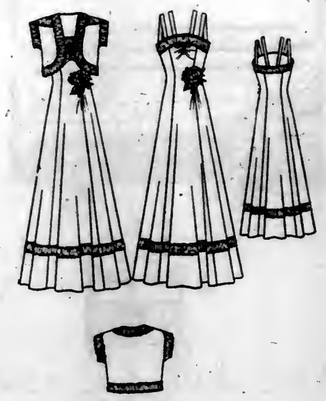


The ornamental design for a redingote as shown.

108,565
DESIGN FOR A COMBINED WASHING MACHINE AND WRINGER
Fred A. Conterman, Jamestown, N. Y., assignor to Blackstone Manufacturing Company, Inc., Jamestown, N. Y., a corporation of New York
Application December 24, 1937, Serial No. 73,842
Term of patent 7 years

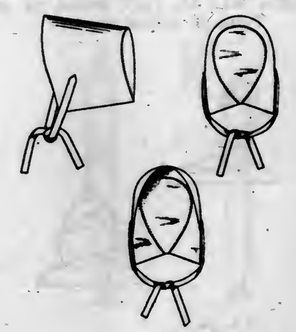
The ornamental design for a combined washing machine and wringer as shown.

108,566
DESIGN FOR A COMBINED WRINGER AND WASHING MACHINE
Fred A. Conterman, Jamestown, N. Y., assignor to Blackstone Manufacturing Company, Inc., Jamestown, N. Y., a corporation of New York
Application December 24, 1937, Serial No. 73,843
Term of patent 7 years



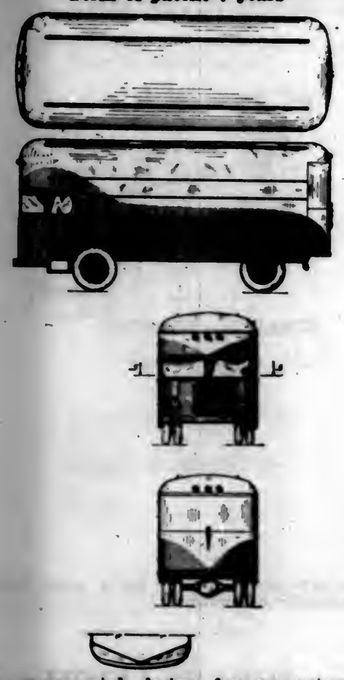
The ornamental design for a combined wringer and washing machine as shown and described.

108,567
DESIGN FOR A COMBINED LAMP, SMOKING STAND, AND RADIO TUNING UNIT
Daniel J. Crowley, Grosse Pointe, Mich.
Application November 15, 1937, Serial No. 72,894
Term of patent 14 years



The ornamental design for a combined lamp, smoking stand and radio tuning unit substantially as shown and described.

108,568
DESIGN FOR A DRESS ENSEMBLE
Alice Engel, New York, N. Y.
Application January 12, 1938, Serial No. 74,246
Term of patent 3½ years



The ornamental design for a dress ensemble, substantially as shown.

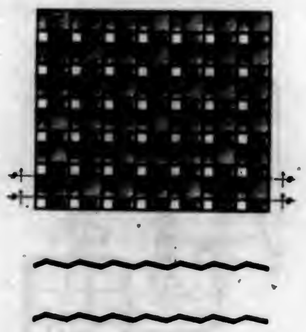
108,569
DESIGN FOR A BONNET
William P. Fortune, New York, N. Y.
Application January 20, 1938, Serial No. 74,452
Term of patent 7 years

The ornamental design for a bonnet, substantially as shown.

108,570
DESIGN FOR AN AUTOMOTIVE TRUCK
Vacter G. Garnett and Edward V. Garnett, Denver, Colo.
Application November 26, 1937, Serial No. 73,205
Term of patent 7 years

The ornamental design for an automotive truck, as shown.

108,571
DESIGN FOR A HOUSE MARKER OR THE LIKE
Oscar O. Godwin, West Palm Beach, Fla.
Application May 19, 1937, Serial No. 69,432
Term of patent 7 years



The ornamental design for a house marker or the like, as shown.

108,572
DESIGN FOR A TEXTILE FABRIC
William Harm, Philadelphia, Pa.
Application January 26, 1938, Serial No. 74,547
Term of patent 3½ years

The ornamental design for a textile fabric, substantially as shown.

108,573
DESIGN FOR A SHEET METAL FOR MAKING BAKING RECEPTACLES OR SIMILAR ARTICLES
Joseph G. Jackson, Oak Park, Ill., assignor to The Edward Katzinger Company, Chicago, Ill., a corporation of Illinois
Application September 5, 1936, Serial No. 64,730
Term of patent 14 years

The ornamental design for a sheet metal for making baking receptacles or similar articles as shown and described.

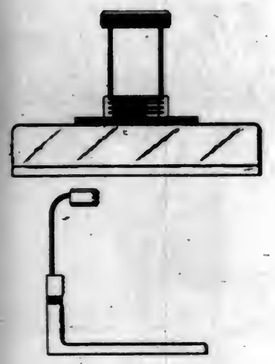
108,574
DESIGN FOR AN ESCUTCHEON PLATE FOR A COMBINED RADIO TUNING DIAL AND CONTROL PANEL OR THE LIKE
Le Roy J. Leishman, Los Angeles, Calif.
Application November 8, 1937, Serial No. 72,710
Term of patent 7 years

The ornamental design for an escutcheon plate for a combined radio tuning dial and control panel, or the like, substantially as shown.

108,575
DESIGN FOR AN ALUMINUM ALLOY INGOT OR THE LIKE
Henry Lindenberger, Chicago, Ill., assignor to U. S. Reduction Co., East Chicago, Ind., a corporation of Illinois
Application August 25, 1937, Serial No. 71,311
Term of patent 14 years

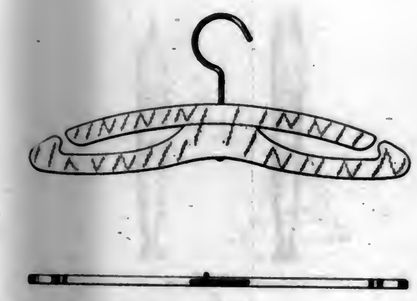
The ornamental design for an aluminum alloy ingot or the like as shown.

108,576
DESIGN FOR A DOLL
Fred H. Morehead, New Market, Va.
Application June 10, 1937, Serial No. 69,778
Term of patent 7 years



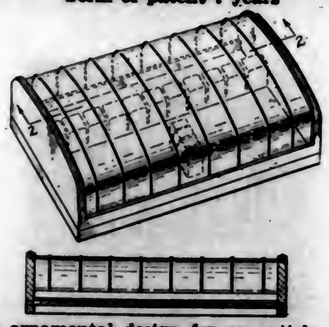
The ornamental design for a doll, as shown.

108,577
DESIGN FOR A LIP BRUSH OR SIMILAR ARTICLE
Charles A. Mureau, Los Angeles, Calif.
Application December 22, 1937, Serial No. 73,802
Term of patent 14 years



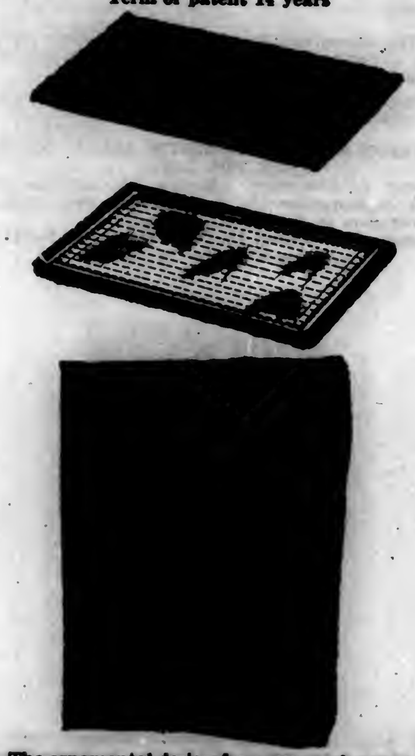
The ornamental design for a lip brush or similar article, substantially as shown and described.

106,578
DESIGN FOR A COMBINED TOP, BACK SPLASH PANEL, AND LIGHTING UNIT FOR RANGES
Elmer D. Pellegrin, Woodstock, Ill., assignor to Geo. D. Roper Corporation, Rockford, Ill., a corporation of Illinois
Application December 13, 1937, Serial No. 73,589
Term of patent 7 years



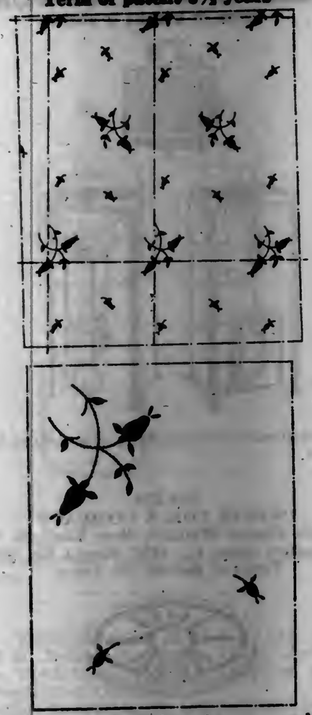
The ornamental design for a combined top, back splash panel, and lighting unit for ranges substantially as shown.

106,579
DESIGN FOR A COAT HANGER
Benjamin Perrone, Jackson Heights, Long Island, N. Y.
Application December 7, 1937, Serial No. 73,418
Term of patent 7 years



The ornamental design for a coat hanger, as shown.

106,580
DESIGN FOR AN ARTICLE DISPLAY CASE
Thomas J. Pilliod, Swanton, Ohio, assignor to The Pilliod Cabinet Company, Swanton, Ohio, a corporation of Ohio
Application May 8, 1937, Serial No. 69,241
Term of patent 7 years



The ornamental design for an article display case, substantially as shown.

106,581
DESIGN FOR A RUG
William W. Robinson, Memphis, Tenn., assignor to McCallum & Robinson, Inc., Memphis, Tenn., a corporation of Tennessee
Application November 19, 1936, Serial No. 66,021
Term of patent 14 years

The ornamental design for a rug, as shown, and described.

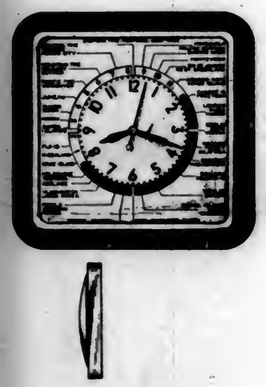
106,582
DESIGN FOR AN EMBROIDERED TEXTILE FABRIC
Isidor J. Shorser, West New York, N. J.
Application January 31, 1938, Serial No. 74,728
Term of patent 3½ years

The ornamental design for an embroidered textile fabric substantially as shown and described.

106,583
DESIGN FOR AN OPHTHALMIC MOUNTING
Edward M. Splaine, Southbridge, Mass., assignor to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Application October 26, 1936, Serial No. 65,515
Term of patent 14 years

The ornamental design for an ophthalmic mounting substantially as shown and described.

106,584
DESIGN FOR A BRIDGE FOR AN OPHTHALMIC MOUNTING
Edward M. Splaine, Southbridge, Mass., assignor to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Application October 26, 1936, Serial No. 65,516
Term of patent 14 years

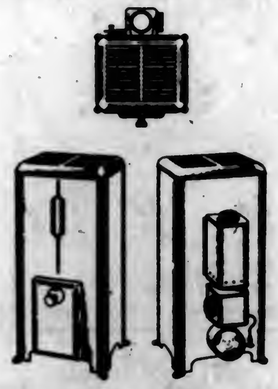


The ornamental design for a bridge for an ophthalmic mounting, substantially as shown and described.

106,585
DESIGN FOR A TOKEN DISPENSER
Walter J. Taylor, Kansas City, Kans.
Application August 2, 1937, Serial No. 70,780
Term of patent 3½ years

The ornamental design for a token dispenser, as shown and described.

106,586
DESIGN FOR A CLOCK FACE
Walter D. Teague, Forest Hills, N. Y., assignor to Warren Telechron Company, a corporation of Maine
Application October 28, 1937, Serial No. 72,473
Term of patent 14 years

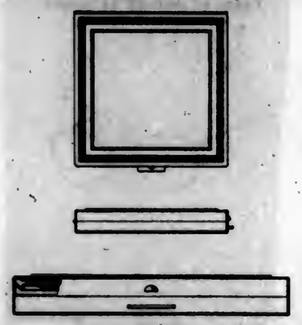


The ornamental design for a clock face, as shown and described.

106,587
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE
Abe Tillman, New York, N. Y.
Application November 24, 1937, Serial No. 73,153
Term of patent 3½ years

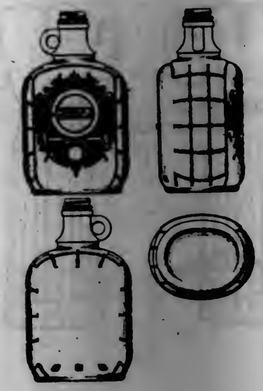
The ornamental design for a textile fabric or similar article, substantially as shown and described.

106,588
DESIGN FOR A CIRCULATING HEATER
Boyd W. Tullis, Wichita, Kans., assignor to The Coleman Lamp and Stove Company, Wichita, Kans.
Application May 21, 1937, Serial No. 69,471
Term of patent 7 years



The ornamental design for a circulating heater, as shown.

106,589
DESIGN FOR A COMPACT
Sadye Elaine Wallace, New York, N. Y.
Application June 14, 1937, Serial No. 69,842
Term of patent 3½ years



The ornamental design for a compact as shown and described.

106,590
DESIGN FOR A VANITY CASE OR SIMILAR ARTICLE
David H. Zell, Brooklyn, N. Y.
Application December 14, 1937, Serial No. 73,596
Term of patent 14 years

The ornamental design for a vanity case or similar article substantially as shown and described.

106,591
DESIGN FOR A JUG
Lorenzo Colla, New York, N. Y., assignor to Roma Wine Company, Inc., Lodi, Calif., a corporation of California
Application December 28, 1937, Serial No. 73,916
Term of patent 7 years

The ornamental design for a jug substantially as shown.

106,592
DESIGN FOR A GLASS JAR
Ronald H. Dallas, Southgate, Calif., assignor to Glass Containers, Inc., Los Angeles, Calif., a corporation of California
Application December 27, 1937, Serial No. 73,874
Term of patent 7 years

The ornamental design for a glass jar as shown and described.

106,593
DESIGN FOR A BOTTLE
Edwin W. Fuerst, Toledo, Ohio, assignor to National Distillers Products Corporation, Richmond, Va., a corporation of Virginia
Application December 13, 1937, Serial No. 73,572
Term of patent 14 years

The ornamental design for a bottle substantially as shown.

106,594
DESIGN FOR A JAR
Walter L. Kennedy, Baltimore, Md., assignor to Crosse and Blackwell Company, Baltimore, Md., a corporation of Maryland
Application January 13, 1938, Serial No. 74,263
Term of patent 7 years

The ornamental design for a jar substantially as shown and described.

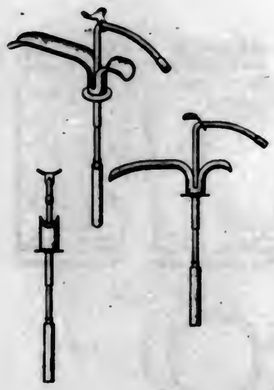
108,595
DESIGN FOR A COMBINED BOOK AND NEWSPAPER HOLDER
James I. Kumauchi, New York, N. Y.
Application November 11, 1937, Serial No. 72,813
Term of patent 14 years

The ornamental design for a combined book and newspaper holder, as shown.

108,596
DESIGN FOR A BRACKET FOR A MAP OR SIMILAR ARTICLE
Archibald E. MacQuarrie, Minneapolis, Minn.
Application September 7, 1937, Serial No. 71,495
Term of patent 14 years

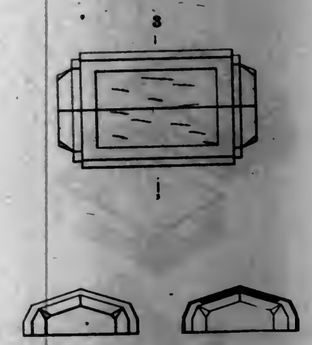
The ornamental design for a bracket for a map or similar article, as shown.

108,597
DESIGN FOR A DISPLAY CABINET
Francis F. Melvin and Bernard C. Howell, Elwood, Ind.
Application June 16, 1937, Serial No. 69,876
Term of patent 7 years



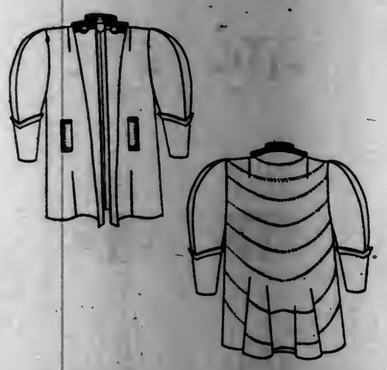
The ornamental design for a display cabinet, as shown.

108,598
DESIGN FOR A DRESS
Murray White, Brookline, Mass.
Application January 3, 1938, Serial No. 74,040
Term of patent 3½ years



The ornamental design for a dress as shown.

108,599
DESIGN FOR A SPRAYER PUMP
Rudolph Bernhardt, Chicago, Ill.
Application December 2, 1937, Serial No. 73,313
Term of patent 7 years

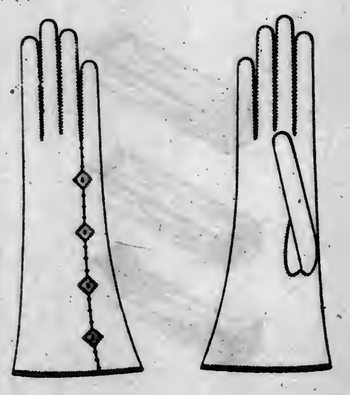


The ornamental design for a sprayer pump as shown.

108,600
DESIGN FOR A WRIST WATCH BEZEL
Richard Jaccarino, Tuckahoe, N. Y.
Application December 11, 1937, Serial No. 73,530
Term of patent 3½ years

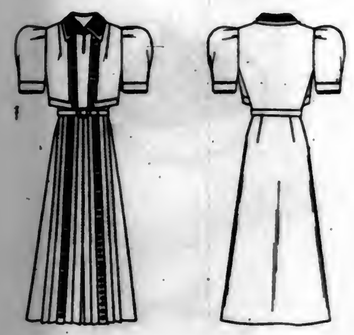
The ornamental design for a wrist watch bezel, as shown and described.

108,601
DESIGN FOR A COAT
Henry Miller, New York, N. Y.
Application December 22, 1937, Serial No. 73,790
Term of patent 3½ years



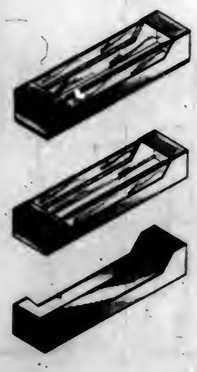
The ornamental design for a coat substantially as shown and described.

108,602
DESIGN FOR A HAT
Alice Rainess, New York, N. Y.
Application January 12, 1938, Serial No. 74,211
Term of patent 3½ years



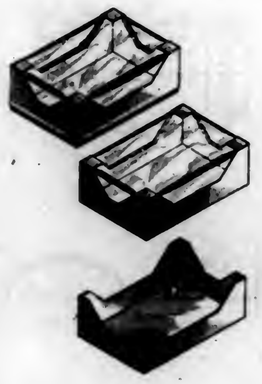
The ornamental design for a hat, substantially as shown.

108,603
DESIGN FOR A GLOVE
Samuel Shapiro, New York, N. Y.
Application December 4, 1937, Serial No. 73,370
Term of patent 3½ years



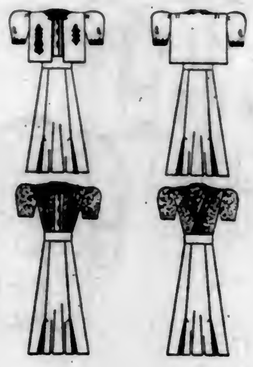
The ornamental design for a glove, substantially as shown.

108,604
DESIGN FOR A DRESS
Frederick Martin Bob Burns, New York, N. Y.
Application January 26, 1938, Serial No. 74,558
Term of patent 3½ years



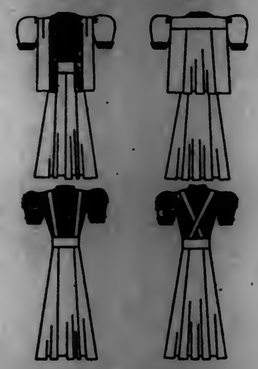
The ornamental design for a dress, substantially as shown.

108,605
DESIGN FOR A DISPLAY BOX
Reginald A. Nagle, Rochester, N. Y., assignor to Flower City Specialty Company, Rochester, N. Y., a corporation of New York
Application December 21, 1937, Serial No. 73,784
Term of patent 14 years



The ornamental design for a display box, substantially as shown.

108,606
DESIGN FOR A DISPLAY BOX
Reginald A. Nagle, Rochester, N. Y., assignor to Flower City Specialty Company, Rochester, N. Y., a corporation of New York
Application December 21, 1937, Serial No. 73,785
Term of patent 14 years



The ornamental design for a display box, substantially as shown.

108,607
DESIGN FOR AN ENSEMBLE DRESS
John Tuman, Mount Vernon, N. Y.
Application February 4, 1938, Serial No. 74,852
Term of patent 3½ years

The ornamental design for an ensemble dress substantially as shown.

108,608
DESIGN FOR AN ENSEMBLE DRESS
John Tuman, Mount Vernon, N. Y.
Application February 4, 1938, Serial No. 74,853
Term of patent 3½ years

The ornamental design for an ensemble dress substantially as shown.

108,609
DESIGN FOR A BATHING SUIT OR SIMILAR ARTICLE
David Watinsky, Mount Vernon, N. Y.
Application December 31, 1937, Serial No. 74,027
Term of patent 3½ years

The ornamental design for a bathing suit or similar article, as shown and described.
